Introduction to Civil Information Systems

Mark A. Austin

University of Maryland

austin@umd.edu

ENCE 201, Spring Semester 2024

January 24, 2024

Overview

1. Modern Civil Infrastructure Systems
   - Industrial Revolution
   - Transition to Information Era
2. Near-Term Challenges (2020-2060)
   - Crisis in US Infrastructure Investment
   - Urbanization and Sustainable Cities
   - Infrastructure Protection and Recovery
3. Features of Modern Computing
4. Cyber-Physical and Digital Twin Systems
5. Urban and Global Applications
6. Summary (Connections to Scientific Computing)

Modern

Civil Infrastructure

Systems

Modern Civil Infrastructure Systems

Various Sources (Google, ScienceDirect):

- Civil Infrastructure Systems provide for human activity, ranging in scale from buildings to cities.
- Includes supporting infrastructure: water supply networks; energy networks; transportation systems, communication systems.

Support Human Needs:

- Basic: Access to clean air and clean water.
- Health: Access to good medical services.
- Economic: Affordable low maintenance housing.
- Security: Protections against crime, environmental attack.

Modern Civil Infrastructure Systems

- Transportation: Good roads; parking; fast access to work.
- Educational: Access to good schools.
- Green Spaces: Access to parks, bike paths, etc.
- Retail: Access to shopping; reliable supply chains.
- Lifestyle: Access to social and recreational spaces.

Urban Planning and Engineering Concerns:

- Understand short- and long-term planning needs.
- Efficiency in design – aesthetically pleasing design.
- Efficiency in operations – better use of limited resources.
- Improved response to unexpected events.

Framing the Opportunity

We seek:

- Data-driven approaches to measurement of performance in the building environment and identification of trends and patterns in behavior.
- Solutions that account for unique physical, economic, social and cultural characteristics of individual cities.

Sources of Complication:

- Multiple domains; multiple types of data and information.
- Network structures that are spatial and interwoven.
- Behaviors that are distributed and concurrent.
- Many interdependencies among coupled urban subsystems.

Framing the Opportunity

Systems Perspective:

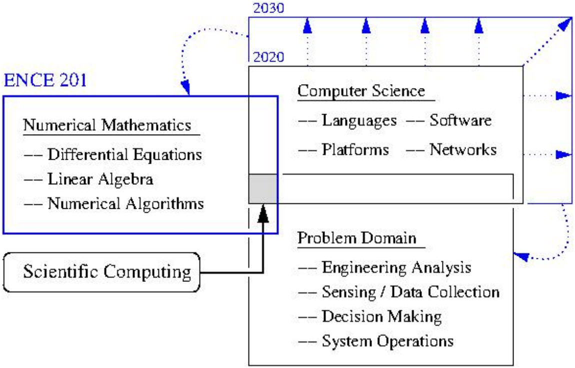
- Entities in the infrastructure environment have both system structure and system behavior ....

Decision makers use behavior modeling to understand:

- Levels of attainable performance.
- Sensitivity of systems to model parameter choices.
- Influence of resource constraints.
- Potential emergent interactions and propogation of cause-and-effect relationships.
- Identification of parts of the systems that are vulnerable.

Framing the Opportunity

ENCE 201: Mathematical Foundations for Behavior Modeling.



Scientific computing lies at the intersection of computer science, numerical mathematics, and domain-specific problem solving.

A Little History

Pathway Forward → Look to the Past

What is Civil Engineering?

Civil Engineering deals with (Civil Engineering, Wikipedia) ...

.

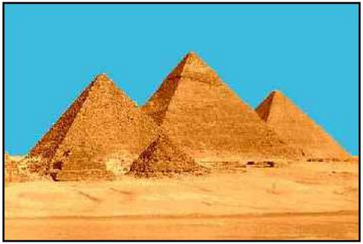
.. the design, construction, and maintenance of the physical and naturally built environment, including roads, bridges, canals, dams, and buildings.

After military engineering, civil engineering is the oldest engineering profession.

Goals during Early Civilization (4000 BC – 6000 BC)

- Problems of survival and basic systems were solved.
- Design and construction methods evolved.

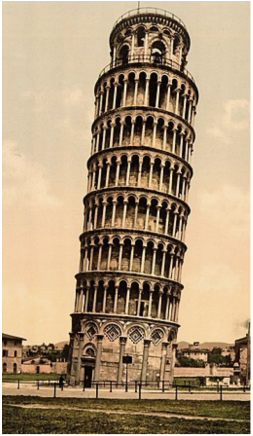
Exemplars of Early Work



- Great Pyramid of Giza, Egypt (20 year construction; finished 2556 BC).
- The Parthenon in Ancient Greece (447-438 BC).
- Construction of the Great Wall of China (220 BC).
- The Romans developed civil structures throughout their empire, including especially aqueducts, insulae (apartment buildings).

Exemplars of Early Work

Leaning Tower of Pisa (12th Century)



- Designed to be the tallest bell tower in Europe.
- Construction: Three stages over 199 years (1173-1372).
- Constructed from white marble.
- Tower leans because of weak unstable subsoil.
- It once leaned at 5.5 degrees.
- Currently leans at 3.99 degrees.
- Has survived 4 earthquakes –ironically, weak subsoil conditions work to protect Pisa from ground accelerations.

Industrial Revolution

Fast forward to the Industrial Revolution: (1760 – 1840).

Year	Milestone
1692	Languedoc Canal. 240 miles long. 100 locks.
1708	Tull's mechanical seed sower → large-scale planting.
1765	Spinning jenny/wheel automates weaving of cloth.
1775	Watt's first efficient steam engine.
1801	Robert Trevithick demonstrates a steam locomotive.
1821	Faraday, electro-magnetic rotation → electric motor.
1834	Babbage analytic engine → forerunner of the computer.
1903	Wright brothers make first powered flight.
1908	Henry Ford mass-produces the Model T.

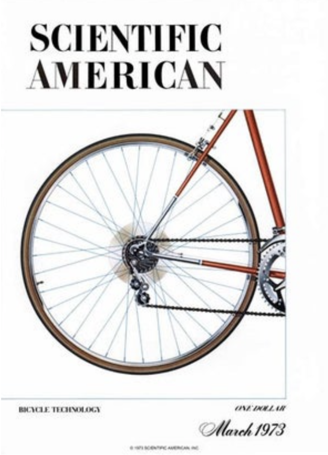
Industrial Revolution

Industrial Revolution Actually Changed the World!

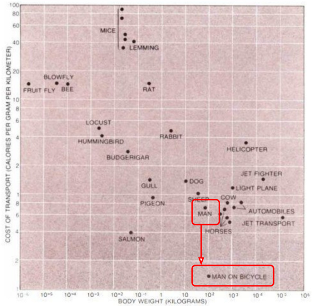
Characteristics	**Stage 1** **Mechanical Era**	**Stage 2** **Electrical Era**
Onset in the U.S.	Late 1700s.	Late 1800s.
Economic Focus	Agriculture/Mining	**Manufacturing**
Productivity Focus	Farming	Factory
Underlying Technologies	**Mechanical Tools**	**ElectroMechanical**
Product Lifecycle	Decades	Years
Human Contribution	Muscle Power	Muscle/Brain Power
Living Standard	Subsistence	**Quality of Goods**
Geographical	Family/Locale	Regional/National

Industrial Revolution

Bicycles: Mass-produced for personal transportation.



Energy Efficiency of Locomotion in Animals / Machines



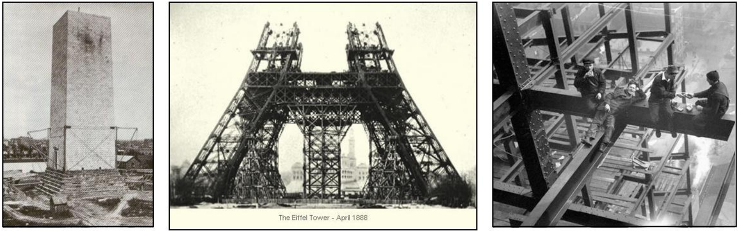
MAN ON A BICYCLE ranks first in efficiency among traveling animals and machines in terms of energy consumed in moving a certain distance as a function of body weight. The rate of energy consumption for a bicyclist (about .15 calorie per gram per kilometer) is approximately a fifth of that for an unaided walking man (about .75 calorie per gram per kilometer). With the exception of the black point representing the bicyclist (*lower right*), this graph is based on data originally compiled by Vance A. Tucker of Duke University.

Source: Wilson S.S., Bicycle Technology, Scientific American, March, 1973.

Industrial Revolution

Advances in Civil Engineering

Year	Milestone
1854	Bessemer invents steel converter.
1849	Monier develops reinforced concrete.
1863	Siemens-Martin makes steel available in bulk.



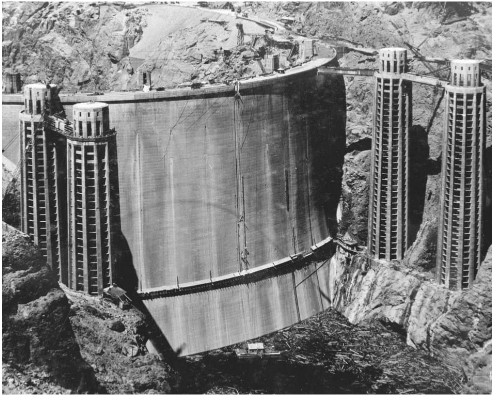
Skyscrapers

Construction of the Empire State Building (1930-1931)

- New materials → design of tall structures having large open interior spaces.
- Elevators (1857) → vertical transportation building occupants.
- Mechanical systems → delivery of water, heating and cooling.
- Collections of skyscrapers → high-density CBDs/commuter society.

Dams

Construction of the Hoover Dam (1931-1935)



Hydroelectric power for Arizona, Nevada, Southern California; controls floods; provide irrigation water.

Bridges

Construction of the Golden Gate (1933-1937)

Bridges

Construction of the Golden Gate (1933-1937)

Bridges

Golden Gate Bridge (May 27, 1937)

Transition to Information Era

Since 1990 we have been in an Information Era

Characteristics	**Stage 2** **Electrical Era**	**Stage 3** **Information Era**
Onset in the U.S.	Late 1800s.	**Late 1900s.**
Economic Focus	Manufacturing	Services
Technologies	ElectroMechanical	**Information**
Product Lifecycle	Years	Months
Living Standard	Quality of Goods	**Quality of Life**
Human Contribution	Muscle/Brain Power	Enhanced Brain Power
Geographical Impact	Regional/National	**Global**

Transition to Information Era

Metrics of Good Engineering Design:

- A good engineering design works correctly, has good performance, and is economical.
- Functionality and performance are resilient to uncertainties.
- System can be easily upgraded to take advantage of new technologies.

Metrics of Good Systems Operation:

A well-run system has "situational awareness" and handles unexpected events:

- Sense the system state and surrounding environment,
- Look ahead and anticipate events, and
- Take action to control system behavior.

Post- Industrial Revolution (Mid-1900s)

New types of systems – planes, trains and automobiles – rely on human involvement as a means for sensing and controlling behavior, e.g.,

- Driving a car,
- Manual collection of road tolls,
- Traffic controllers at an airport,
- Manual focus of a camera.

Systems work, but:

- Humans are slow.
- Humans make mistakes.
- They also easily tire.

Design of Information-Age Systems

Premise of Information-Age System Design:

- Advances in computer software, sensing, and wireless networking technologies can work together to expand the functionality and performance of systems.

Trend toward Automation:

- New types of systems where human involvement for management of system functionality is replaced (or partially replaced) by software automation.

Civil Engineering Applications:

- Automated road toll collection (Rt. 200).
- Automated baggage handling systems at airports.

Skyscrapers, Bridges → High-Density Urban Development

Urban Development in NYC

Urban Development in Shanghai

Advances in Computing and Analysis

Emergence of New Architectural Forms

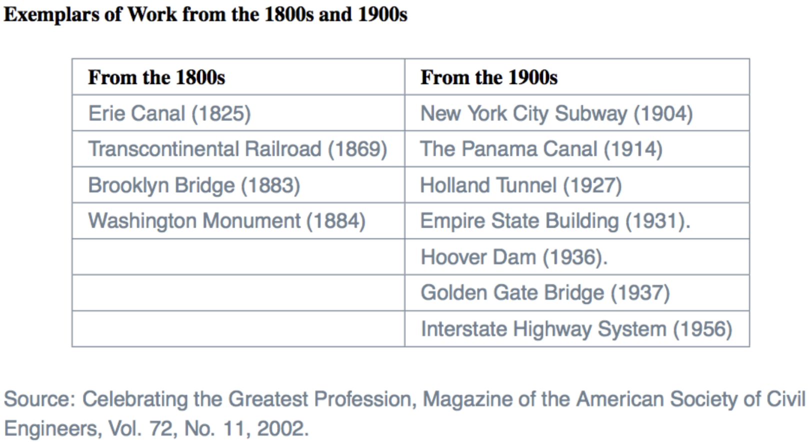
Advances in Computing and Analysis

Parametric Architectural Design

Near-Term Challenges

Civil Engineers need to create the infrastructure for citizens of the Information Era

Crisis in US Infrastructure Investment



Exemplars of Work from the 1800s and 1900s

From the 1800s	From the 1900s
Erie Canal (1825)	New York City Subway (1904)
Transcontinental Railroad (1869)	The Panama Canal (1914)
Brooklyn Bridge (1883)	Holland Tunnel (1927)
Washington Monument (1884)	Empire State Building (1931).
	Hoover Dam (1936).
	Golden Gate Bridge (1937)
	Interstate Highway System (1956)

Source: Celebrating the Greatest Profession, Magazine of the American Society of Civil Engineers, Vol. 72, No. 11, 2002.

Crisis in US Infrastructure Investment

Universal Observations:

- Aging infrastructure becomes expensive to maintain.
- New (replacement) infrastructure is very expensive.
- Politicians are eager to talk up Infrastructure Investment , but slow to deliver ….

Bottom line:

- Critical infrastructure is taken for granted and not a national priority (ASCE, IEEE).

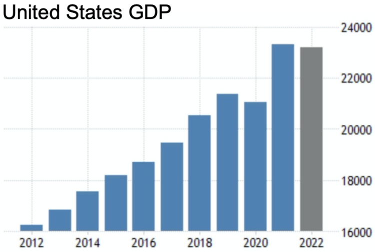
Delay, delay, delay ….

Bangkok, Thailand

Crisis in US Infrastructure Investment

Statistics:

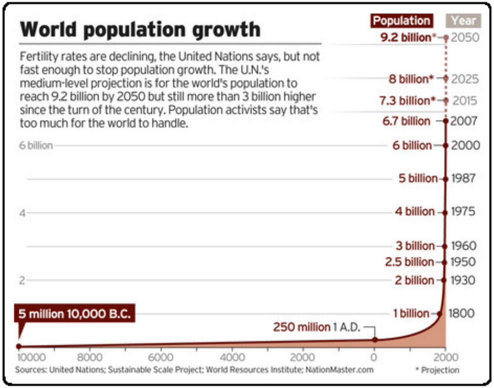
- US: Post World-War II (1950-1970): 3% of Gross Domestic Product (GDP)
- US: 1980-present: 2% of GDP.
- China: 5% GDP.
- India: 9% GDP.



Infrastructure Investment and Jobs Act (2021).

- Invest $1.2T over 10 years.
- Sounds like a lot – but is it too low, too high?
- Increases investment by 0.5% of GDP.

World Population Forecasts



World population growth

Fertility rates are declining, the United Nations says, but not fast enough to stop population growth. The U.N.'s medium-level projection is for the world's population to reach 9.2 billion by 2050 but still more than 3 billion higher since the turn of the century. Population activists say that's too much for the world to handle.

Sources: United Nations; Sustainable Scale Project; World Resources Institute; NationMaster.com

* Projection

Increasing Population → Increased Demand on Limited Resources → Increasing need for Improvements to System Efficiency.

Urbanization and Sustainable Cities

Urbanization in America:

- In 2010, 82 percent of Americans lived in cities.
- By 2050 it will be 90 percent.

Cities are responsible for:

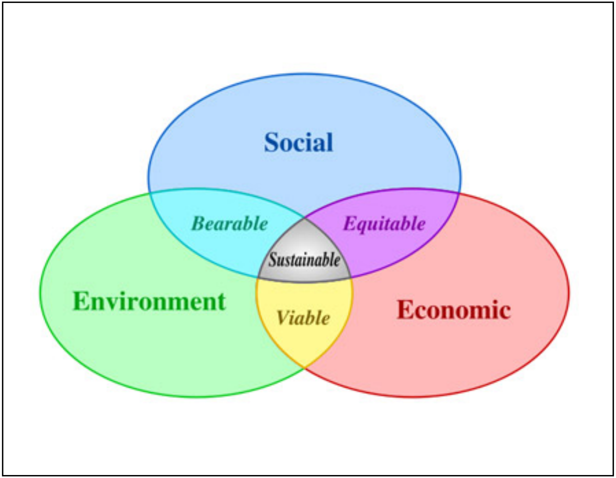
- Two thirds of the energy used,
- 60 percent of all water consumed, and
- 70 percent of all greenhouse gases produced worldwide.

Sustainable cities (SIEMENS, Sustainable Cities, USA):

- Environmentally friendly infrastructures;
- Improved quality of life for residents;
- Good economics.

Sustainable Urban Systems

Sustainability involves physical, organizational and social systems.



Sustainable Urban Systems

Urban systems are like plants in your garden:

- Cities are defined by their emergent properties (e.g., beautiful flower ⇔ New York City Skyline).
- Cities grow and fourish based on societal and economic stimulus, and fall into decay when stimulus is absent.

But sustainability is a tough problem:

- Many of the world's large urban areas – so-called mega-cities – are in poor economic shape.

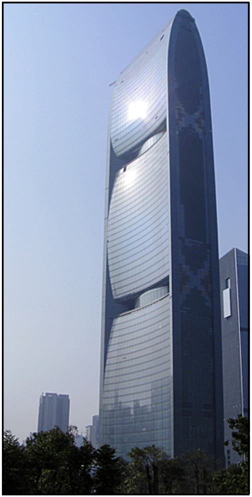
Cities are system of systems:

- Subsystems have a preference to operate as independently as possible from the other subsystems.
- Strategic collaborations needed to raise levels of attainable performance and limit cascading failures.

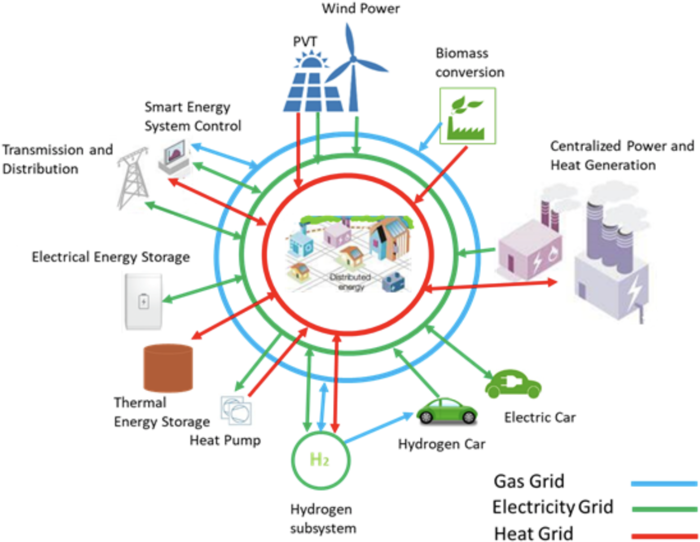
Integrated Energy Systems

Pearl River Tower (2010):

- High performance structure designed to produce as much energy as it consumes.
- Guides wind to a pair of openings at its mechanical floors.
- Wind drives turbines that generate energy for the heating, ventilation and air conditioning systems.
- Openings provide structural relief, by allowing wind to pass through the building.



Integrated Energy Systems (Proposed)



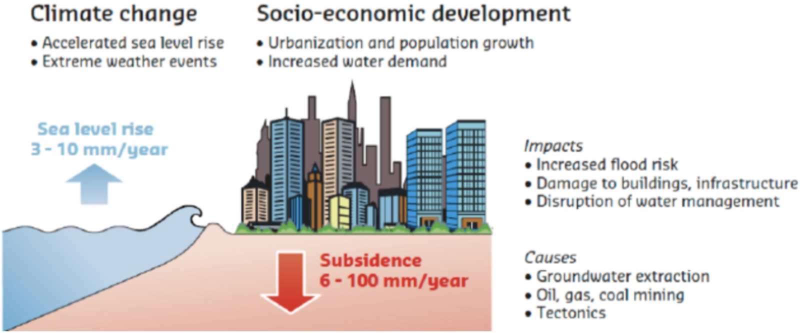
Infrastructure Protection and Recovery

New Threats to Urban Infrastructure

Coastal Cities are Sinking: (St. Mark's Square, Venice, Italy)

New Threats to Urban Infrastructure

Coastal Cities are Sinking: (within the US too ...)



Climate change
- Accelerated sea level rise
- Extreme weather events

Socio-economic development
- Urbanization and population growth
- Increased water demand

Sea level rise
3 - 10 mm/year

Subsidence
6 - 100 mm/year

Impacts
- Increased flood risk
- Damage to buildings, infrastructure
- Disruption of water management

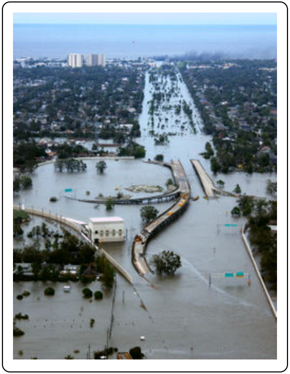
Causes
- Groundwater extraction
- Oil, gas, coal mining
- Tectonics

Statistics: New Orleans, 2 inches per year; Houston, 0.8 inches per year; Miami, 12 inches in the past 100 years. Virginia Beach, 12 inches in the past 50 years.

Resilience of Urban Infrastructure

Example. Cascading Failures in Hurricane Katrina

- Hurricane Katrina caused a storm surge which, in turn, resulted in the failure of levees around New Orleans.
- This is a failure in the waterway network.
- A more conservative (expensive) design might have prevented this failure.
- But the failure didn't stop there.

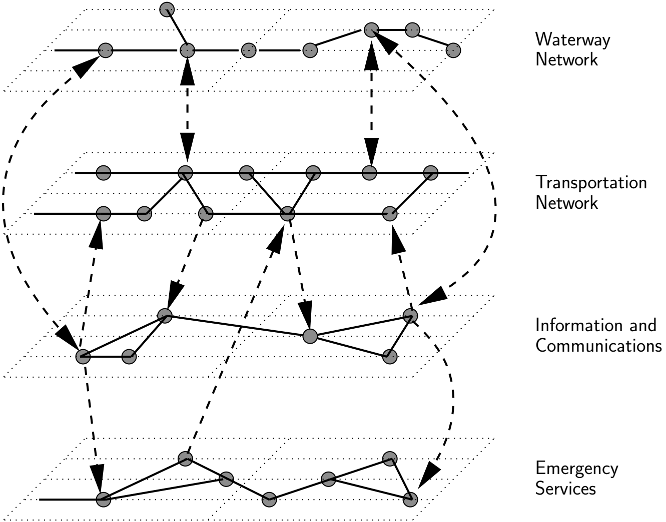


Resilience of Urban Infrastructure

Cascading Failures in Hurricane Katrina:

- **Waterway system failure.** The levees were insufficint to resist the storm surge.
- **Highway and electrical power system failures.** Flooding resulted in failure of the electrical power and highway systems.
- **Federal emergency failures.** Inhabits had to flee their homes, but few plans were in place for their orderly evacuation.
- **Social network failures.** After the inhabitants left their homes, looters stole property from evacuated properties.
- **Political system failures.** ...

Dependencies Among Urban Networks



Planning for Disaster Relief and Recovery

Lessons Learned

Cascading failures of this type indicate that:

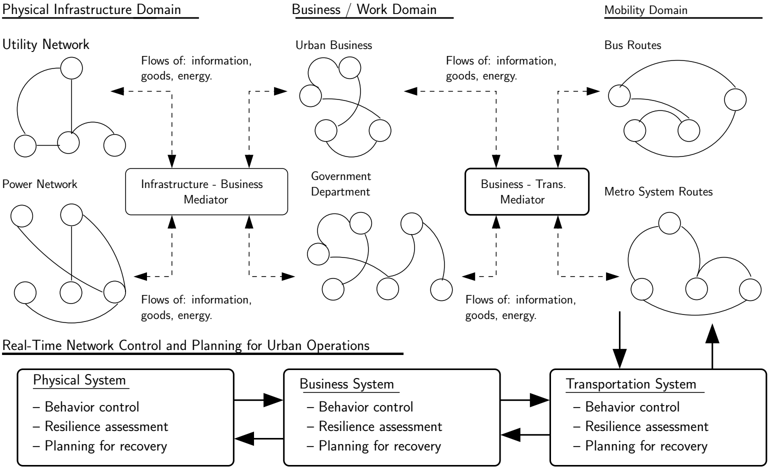
- There is a need to understand and manage interactions among infrastructure networks and organizational and societal factors.

Basic Questions

- What kinds of dependencies exist between the networks?
- How will a failure in one network impact other networks? These are so-called cascading failures.
- What parts of a system are most vulnerable?

We need to look at interactions between network models.

Near-Term View of Assessment & Planning for Recovery



Physical Infrastructure Domain

Business / Work Domain

Mobility Domain

Utility Network

Urban Business

Bus Routes

Flows of: information, goods, energy.

Flows of: information, goods, energy.

Power Network

Infrastructure - Business Mediator

Business - Trans. Mediator

Metro System Routes

Flows of: information, goods, energy.

Flows of: information, goods, energy.

Real-Time Network Control and Planning for Urban Operations

Physical System

- Behavior control
- Resilience assessment
- Planning for recovery

Business System

- Behavior control
- Resilience assessment
- Planning for recovery

Transportation System

- Behavior control
- Resilience assessment
- Planning for recovery

Planning for Protection and Recovery

Critical Role of Sensing:

- Need situational awareness to understand what is actually happening (or about to happen) in a city.
- Sense the spatial, temporal, and intensity aspects of environmental phenomena (e.g., fires, flooding) and their impact on natural (e.g., air quality) and man-made systems (e.g., transportation networks, food chains).

Goal and Approach:

- Connect measurements and behavior modeling to planning of protection mechanisms and relief actions.
- Create warning systems that can look ahead and predict likely future states of the urban system.
- Use ML to identify events and cause-and-effect relationships. Use AI for distributed system behavior modeling.

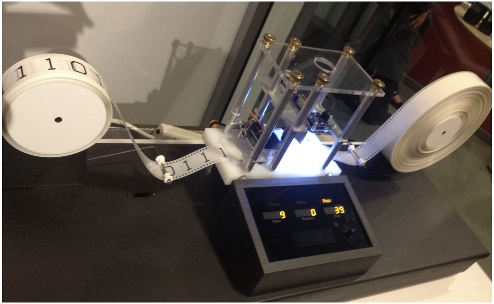
Features of Modern Computing

Key Question: How can we use modern computing technologies to improve Civil Engineering Systems?

Early Models of Computing

Turing Machine Model: 1930s ...

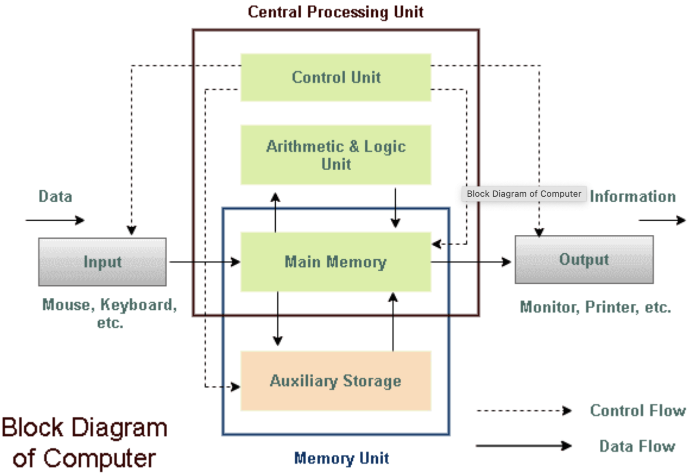
- Alan Turing (1936) created the Turing machine that included the idea of a computer program.



- Turing showed that you can compute anything using only 6 primitives: right, left, print, scan, erase, nothing.

Early Models of Computing

Block Diagram of a Computer: 1980s ...



State-of-the-Art Computing

What does a modern computer do?

- Performs calculations – billions (sometimes even trillions) of calculations per second.
- Remembers results – gigabytes and terabytes of storage.

Modern Programming Languages

- Modern programming languages have a more convenient set of primitives.
- Can abstract methods to create new primitives (e.g., user-defined objects).
- Anything computable in one language is computable in any other programming language.

Man and Machine (Traditional View)

Man	**Machine**
Good at formulating solutions to problems.	Manipulates 0s and 1s.
Can work with incomplete data and information.	Very specific abilities.
Creative.	Requires precise decriptions of problem solving procedures.
Reasons logically, but very slow.	Dumb, but very fast.
Performance is static.	Performance doubles every 18-24 months.
Humans break the rules.	Machines will follow the rules.

Sensible Problem Solving Strategy

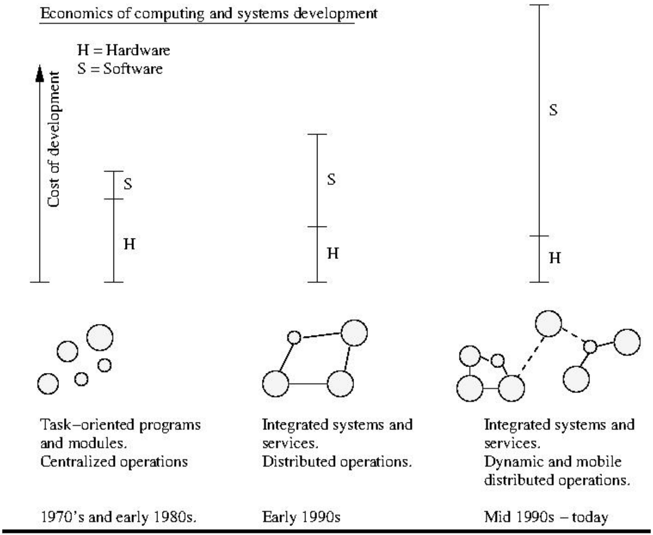
Let engineers and computers play to their strengths:

- Accelerates the solution procedure.
- Enables the analysis of problems having size and complexity beyond manual examination.
- Adds value in areas that will lead to long-term economic growth.

Getting things to work We need to:

- Describe to the computer solution procedures that are completely unambiguous.
- Look at data, organization and manipulation of data, and formal languages.

Expanding Expectations of Computing



Pathway to Improved Programmer Productivity

Increasing System Complexity: Software programmers need to find ways to solve problems at high levels of abstraction.

High–Level Language

Compiler

Low–Level Executable Code

Evolution of Computer Languages

Computer Languages. Formal description – precise grammar – for how a problem can be solved.

Evolution. It takes about a decade for significant advances in computing to occur:

Capability	1970s	1980s	1990s
Users	Specialists	Individuals	Groups
Usage	Numerical computations	Desktop computing	E-mail, web, file transfer.
Interaction	Type at keyboard	Screen and mouse	audio/voice.
Languages	Fortran, C	MATLAB	Python, Java

Popular Computer Languages

Tend to be designed for a specific set of purposes:

- FORTRAN (1950s – today). Stands for formula translation.
- C (early 1970s – today). New operating systems.
- C++ (early 1970s – today). Object-oriented version of C.
- MATLAB (mid 1980s – today). Stands for matrix laboratory.
- Python (1990s – today). Object-oriented scripting language.
- HTML (1990s – today). Layout of web-page content.
- Java (1994 – today). Object-Oriented language for network-based computing.
- XML (late 1990s – today). Description of data on the Web.

Post- 2000 Era

Imagine: What if COVID-19 had arrived in 2000?

- No iPhone, No iPad, No iTunes.
- No Facebook, No Instagram, No WhatsApp.
- No Google Maps, No Google Streetview.
- No Dropbox, No Zoom.

Recent Advances in Technology:

- Average internet speeds: In 2000, 0.07 Mbs; In 2009, 5-7 Mbs; In 2020, 100-200 Mbs; 5G, 1000-2000 Mbs.
- Cloud-based data storage and computational services (AWS).
- New languages: Swift → App development on iPhone/iPad.
- Many new types of sensors and methods of data collection.

Post- 2000 Era

New Infrastructure → New Architectures, Languages, ...

Capability	**2000-present**	**2020-2030**
Users	Groups of people, sensors and computers.	Integration of the cyber and physical worlds.
Usage	Mobile computing. Control of physical systems. Social networking.	Embedded real-time control of physical systems.
Interaction	Touch, multi-touch, proximity.	....
Languages	XML, RDF, OWL.	New languages to support time-precise computations.

Post-2010 Era → Emergence of AI

State-of-the-Art Implementation (2020, Google, Siemens, IBM)

- AI and ML will be deeply embedded in new software and algorithms.

Artificial Intelligence:

- Knowledge representation and reasoning with ontologies and rules. Semantic graphs. Executable event-based processing.

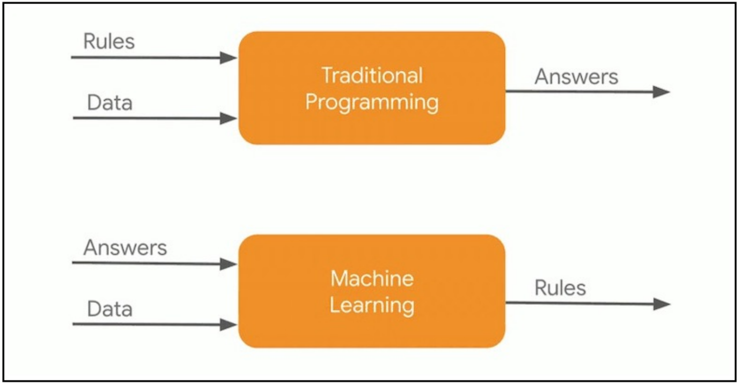
Machine Learning:

- Modern neural networks. Input-to-output prediction.
- Data mining.
- Identify objects, events, and anomalies.
- Learn structure and sequence. Remember stuff.

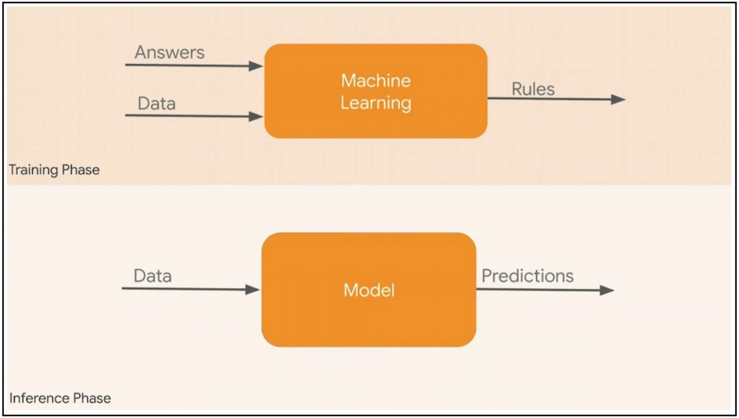
Man and Machine (AI-ML View)

Man	**AI-ML Machine**
- Good at formulating solutions to problems. - Can work with incomplete data and information. - Creative. - Reasons logically, but very slow. Forgetful. - Performance is static. - Humans make the rules, then they break them.	- Manipulates Os and 1s. - Can work with incomplete data and information. - Creative. - Fast logical reasoning. - Performance doubles every 18-24 months. - Data mining can discover the rules.

Traditional Programming vs AI-ML Workflow

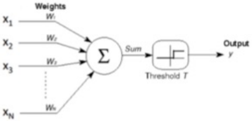


Traditional Programming vs AI-ML Workflow



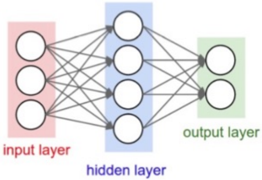
Machine Learning Capabilities (1980-1990)

Expressive Power of a Neural Network

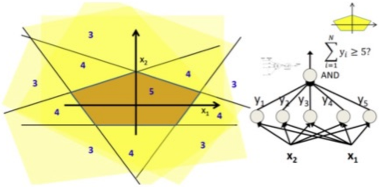


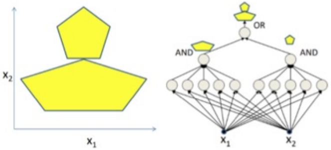
$$y = \begin{cases} 1 & \text{if} \quad \sum_{i=1}^{d} w_i x_i \geq T \\ 0 & \text{else} \end{cases}$$

Neural Network with Single Hidden Layer



Approximation of Functions / Boolean Logic





Machine Learning Capabilities (1997-2014)

Learning Streams of Text

- Download complete works of Shakespeare (5.4 million characters)
- Train machine to remember text.
- Write new Shakespeare!

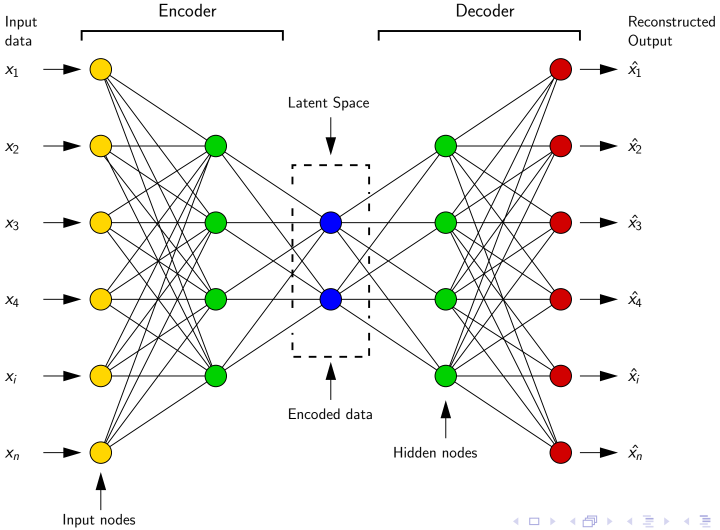
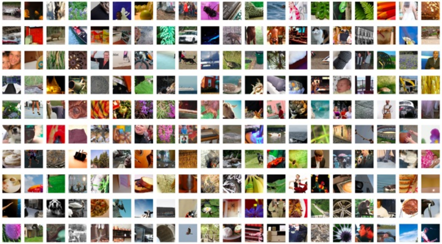
Classification of Machine Learning Problems

AutoEncoder (Encoder-Decoder-Reconstruction)



Classification of Machine Learning Problems

ImageNet and Deep Learning (2009-present)



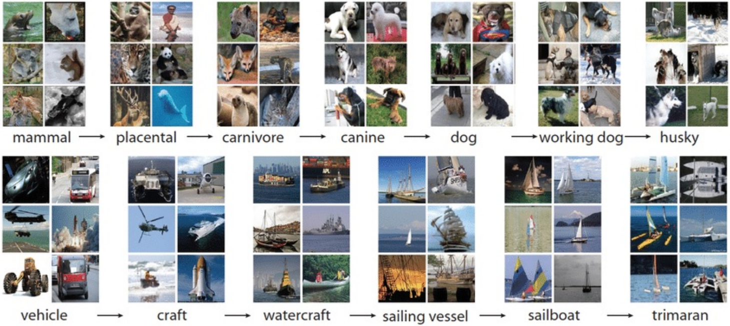
Indexed Database of 14.2 million Images

- Project initiated by Fei Fei Li in 2006
- Image annotation process crowd sourced via Amazon's Mechanical Turk. Categories derived from WordNet.
- Well organized → supervised machine learning.

Classification of Machine Learning Problems

ImageNet and Deep Learning Capabilities:

- Identify objects in an image.
- 27 high-level categories; 21,800 sub-categories.



ImageNet and Deep Learning

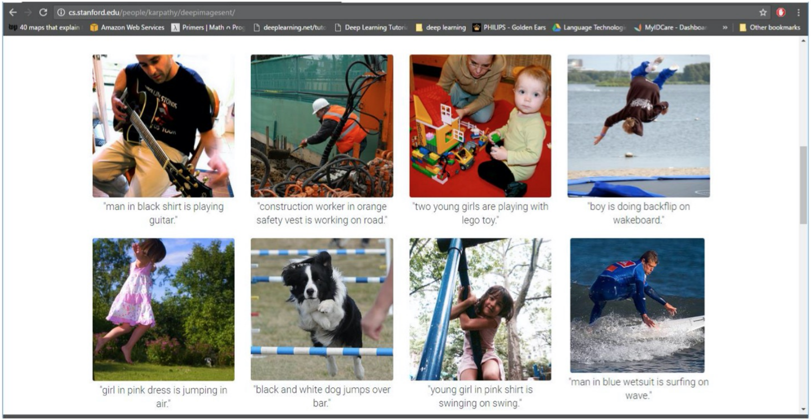
Capabilities (2018):

- Identify relationship among multiple objects in a image.

Example. Dog riding skateboard

ImageNet and Deep Learning

Captions generated by a neural network:



"man in black shirt is playing guitar."

"construction worker in orange safety vest is working on road."

"two young girls are playing with lego toy."

"boy is doing backflip on wakeboard."

"girl in pink dress is jumping in air."

"black and white dog jumps over bar."

"young girl in pink shirt is swinging on swing."

"man in blue wetsuit is surfing on wave."

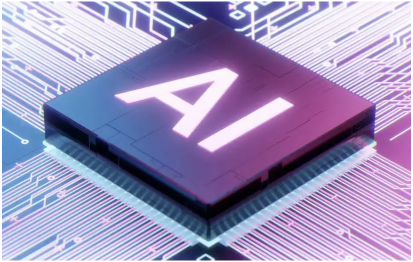
Machine Learning at Scale

Object-recognition module:

- 24 million nodes; 140 million parameters; 15 billion connections.

Source: Fei Fei Li, TEDTalk, YouTube 2015.

AI Chips: Nvidia, Google TPUs, etc ...



Machine Learning in CEE

Opportunities for Machine Learning in CEE:

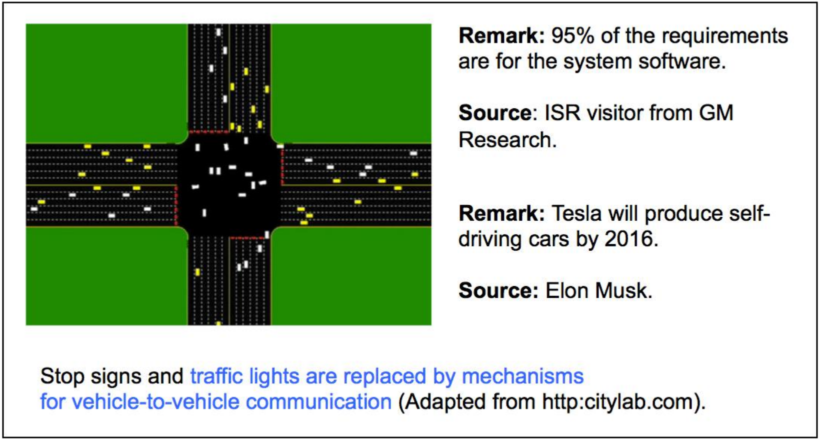
- Predicting system response and performance.
- Interpreting data and formulating models to predict component and subsystem-level properties.
- Information retrieval from images and text.
- Recognizing patterns in streams of sensed data.

Economic Considerations:

- Urban infrastructure is permanent/semi-permanent and very expensive to build and maintain.
- Prioritize improvements to efficiency by identifying and removing bottlenecks in performance.
- Use AI-ML to identify events, cause-and-effect relationships, and design of actions that enhance system performance.

AI-ML Enabled Decision Making (Self-Driving Cars)

Goal. Improve performance by removing bottlenecks → no human driver; no traffic lights.



Remark: 95% of the requirements are for the system software.

Source: ISR visitor from GM Research.

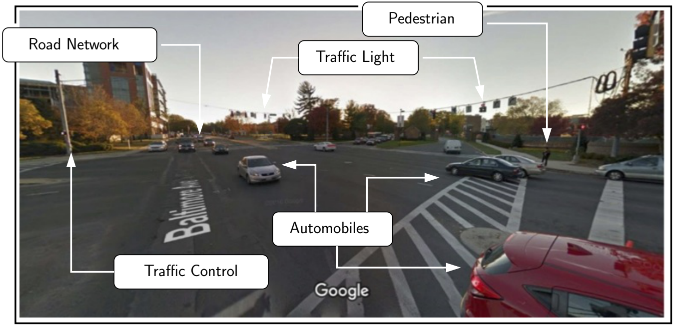
Remark: Tesla will produce self-driving cars by 2016.

Source: Elon Musk.

Stop signs and traffic lights are replaced by mechanisms for vehicle-to-vehicle communication (Adapted from http:citylab.com).

AI-ML Enabled Decision Making (Self-Driving Cars)

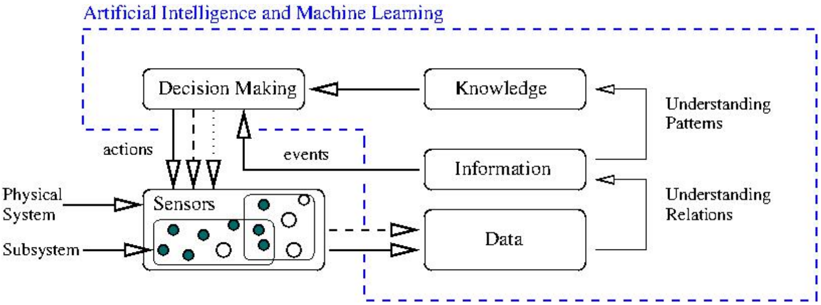
Goal. How to traverse traffic intersection safely and without causing an accident?



Required Capability. Observe, evaluate, reason, take actions.
Challenges. Multiple domains, multiple streams of heterogeneous data, event-driven behavior, dynamic, time critical.

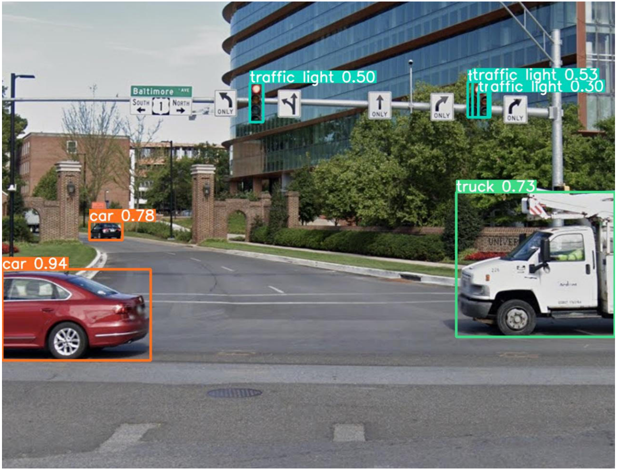
AI-ML Enabled Decision Making (Self-Driving Cars)

Pathway from sensing and data collection to ... action ... improved performance, now enabled by AI and ML capabilities:

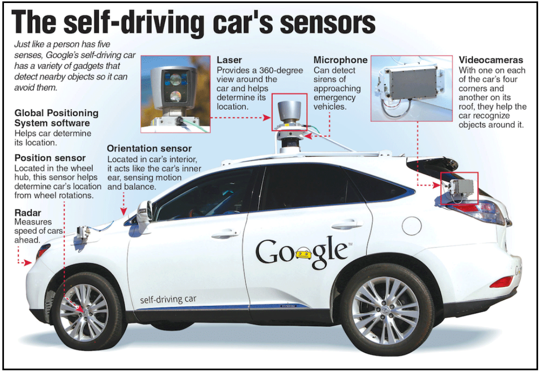


AI-ML Enabled Decision Making (Self-Driving Cars)

Ainur's Experiments with Computer Vision:



AI-ML Enabled Decision Making (Self-Driving Cars)



The self-driving car's sensors

Just like a person has five senses, Google's self-driving car has a variety of gadgets that detect nearby objects so it can avoid them.

Global Positioning System software Helps car determine its location.

Position sensor Located in the wheel hub, this sensor helps determine car's location from wheel rotations.

Radar Measures speed of cars ahead.

Orientation sensor Located in car's interior, it acts like the car's inner ear, sensing motion and balance.

Laser Provides a 360-degree view around the car and helps determine its location.

Microphone Can detect sirens of approaching emergency vehicles.

Videocameras With one on each of the car's four corners and another on its roof, they help the car recognize objects around it.

Today: Modern automobiles → 100 million lines of software.
Tomorrow: Self-Driving automobiles → 200-300 million lines of software.

AI-ML Enabled Decision Making (Self-Driving Cars)

Navigating a Busy Traffic Intersection:

How the car operates

① Any object the vehicle's sensors spot is interpreted by software to determine if it's a pedestrian, cyclist, vehicle or something else.

② Using what it's learned from previous driving, the software makes predictions about what objects will do next.

③ The software analyzes the information to decide whether it is safe to accelerate, turn or hit the brakes.

Source: Google
Graphic: Tribune News Service

How the car sees the world

This computerized image is what Google researchers monitoring sensor data see as they ride in the vehicle.

- 🟪 Other vehicle
- 🟨 Pedestrian
- 🟥 Cyclist
- 🟩🟩🟩🟩🟩 Objects that warrant caution
- 🟥🟥🟥🟥🟥 A crosswalk, indicating the car needs to stop
- ⊡ A traffic signal, warning of upcoming railroad tracks
- 🟩 Path where Google's car intends to go

- Identify various kinds of objects (e.g., vehicles, crosswalk).
- Predict what objects will do next.
- Conduct safety assessment.
- Take action.

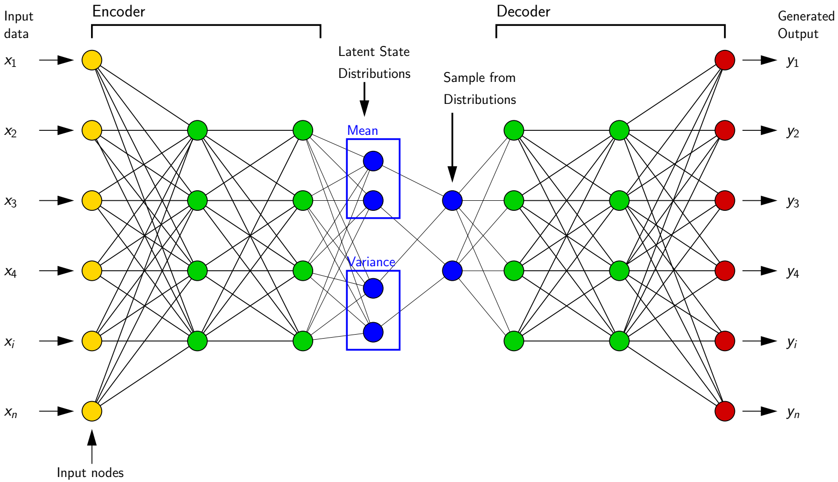
Google DeepMind (2018-2020)

Teach Self-Driving Cars to Navigate a City without a Map

Test Cities: London, Paris, New York.

Post-2020 Era → Explosion of Generative AI

Variational AutoEncoders (Generative Models)

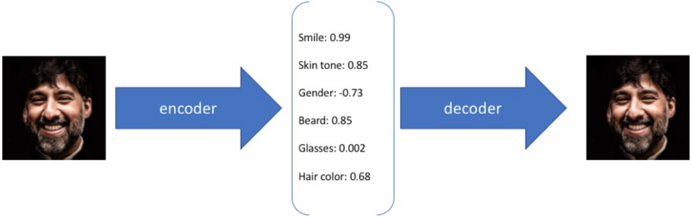


Post-2020 Era → Explosion of Generative AI

Standard Autoencoders vs. Variational Autoencoders:

- A standard autoencoder outputs a single value for each encoding dimension.
- Variational autoencoders provide a probability distribution for each latent attribute.

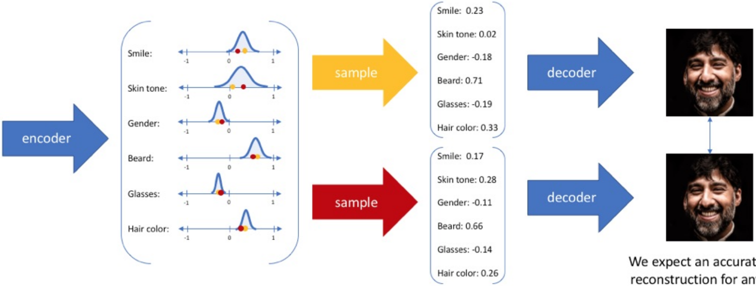
Example: Single value representations for latent attributes:



Latent attributes

Post-2020 Era → Explosion of Generative AI

Image Reconstruction: sampled from latent distributions ...



Latent distributions

Sampled latent attributes

We expect an accurate reconstruction for any sample from the latent state distributions

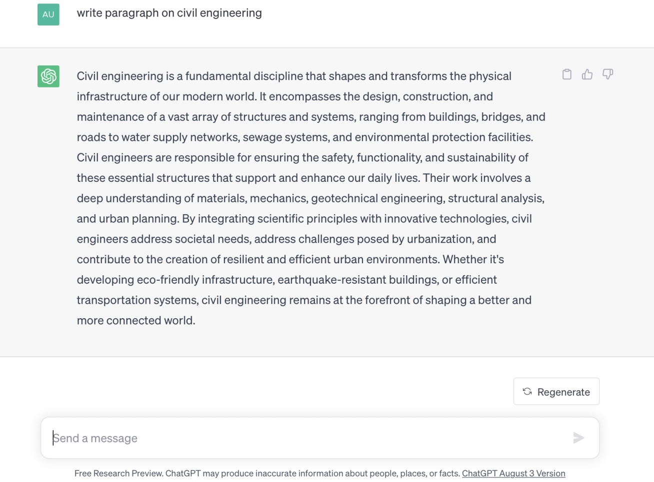
Post-2020 Era → ChatGPT

ChatGPT: Generative Pre-Trained Transformer



write paragraph on civil engineering

Civil engineering is a fundamental discipline that shapes and transforms the physical infrastructure of our modern world. It encompasses the design, construction, and maintenance of a vast array of structures and systems, ranging from buildings, bridges, and roads to water supply networks, sewage systems, and environmental protection facilities. Civil engineers are responsible for ensuring the safety, functionality, and sustainability of these essential structures that support and enhance our daily lives. Their work involves a deep understanding of materials, mechanics, geotechnical engineering, structural analysis, and urban planning. By integrating scientific principles with innovative technologies, civil engineers address societal needs, address challenges posed by urbanization, and contribute to the creation of resilient and efficient urban environments. Whether it's developing eco-friendly infrastructure, earthquake-resistant buildings, or efficient transportation systems, civil engineering remains at the forefront of shaping a better and more connected world.

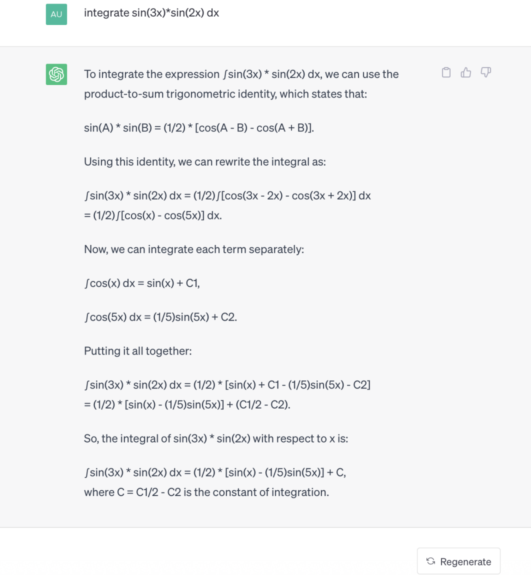
Post-2020 Era → ChatGPT



integrate sin(3x)*sin(2x) dx

To integrate the expression ∫sin(3x) * sin(2x) dx, we can use the product-to-sum trigonometric identity, which states that:

sin(A) * sin(B) = (1/2) * [cos(A - B) - cos(A + B)].

Using this identity, we can rewrite the integral as:

∫sin(3x) * sin(2x) dx = (1/2)∫[cos(3x - 2x) - cos(3x + 2x)] dx
= (1/2)∫[cos(x) - cos(5x)] dx.

Now, we can integrate each term separately:

∫cos(x) dx = sin(x) + C1,

∫cos(5x) dx = (1/5)sin(5x) + C2.

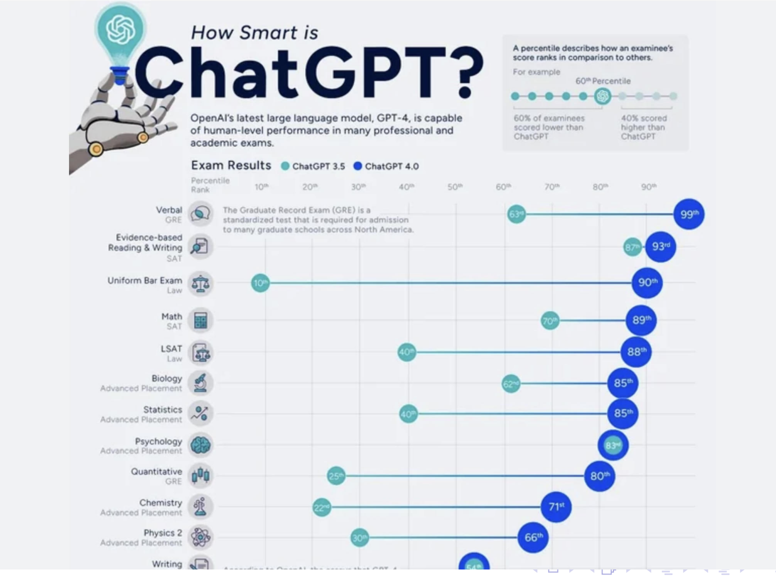
Putting it all together:

∫sin(3x) * sin(2x) dx = (1/2) * [sin(x) + C1 - (1/5)sin(5x) - C2]
= (1/2) * [sin(x) - (1/5)sin(5x)] + (C1/2 - C2).

So, the integral of sin(3x) * sin(2x) with respect to x is:

∫sin(3x) * sin(2x) dx = (1/2) * [sin(x) - (1/5)sin(5x)] + C,
where C = C1/2 - C2 is the constant of integration.

Post-2020 Era → ChatGPT



How Smart is ChatGPT?

OpenAI's latest large language model, GPT-4, is capable of human-level performance in many professional and academic exams.

A percentile describes how an examinee's score ranks in comparison to others.

For example

The Graduate Record Exam (GRE) is a standardized test that is required for admission to many graduate schools across North America.

Cyber-Physical Systems

New Computing Infrastructure → New System Abstractions

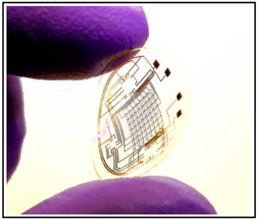
Cyber-Physical Systems

General Idea

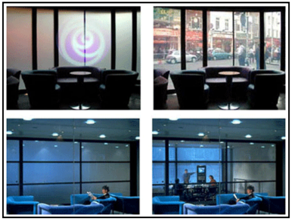
Embedded computers and networks monitor and control the physical processes, usually with feedback loops where computation affects physical processes, and vice versa.

Two Examples

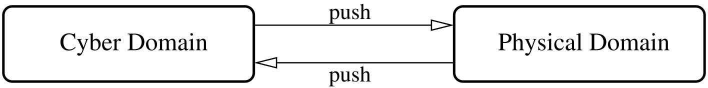
Programmable Contact Lens



Programmable Windows



Cyber-Physical Systems Overview



C–P Structure

Cyber capability in every physical component
Executable code
Networks of computation
Heterogeneous implementations

Spatial and network abstractions

- –– physical spaces
- –– networks of networks

Sensors and actuators.

C–P Behavior

Dominated by logic
Control, communications
Stringent requirements on timing
Needs to be fault tolerant

Physics from multiple domains.
Combined logic and differential equations.
Not entirely predictable.
Multiple spatial– and temporal– resolutions.

Cyber-Physical Systems

Physical System Concerns

- Design success corresponds to notions of enhanced performance, resilience and reliability.
- Behavior is constrained by conservation laws (e.g., conservation of mass, conservation of momentum, conservation of energy, etc..).
- Behavior often described by families of differential equations.
- Behavior tends to be continuous – usually there will be warning of imminent failure.
- Behavior may not be deterministic – this aspect of physical systems leads to the need for reliability analysis.
- For design purposes, uncertainties in behavior are often handled through the use of safety factors.

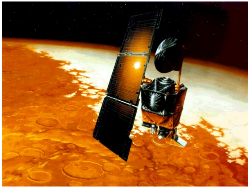
Cyber-Physical Systems

Software System Concerns

- Design success corresponds to notions of correctness of functionality and timeliness of computation.
- Computational systems are discrete and inherently logical. Notions of energy conservation ...etc... and differential equations do not apply.
- Does not make sense to apply a safety factor. If a computational strategy is logically incorrect, then "saying it louder" will not fix anything.
- The main benefit of software is that functionality can be programmed and then re-programmed at a later date.
- A small logical error can result in a system-wide failure.

Cyber-Physical Systems (Notable Failures)

Example 1. NASA's Mars Climate Orbiter, September 1999.



NASA's systems engineering process did not specify the system of measurement. One of the development teams used Imperial measurement; the other metric.

When parameters from one module were passed to another during orbit navigation correct, no conversion was performed, resulting in $125m loss.

Cyber-Physical Systems (Notable Failures)

Example 2. Denver Airport Baggage Handling System

1995. Baggage handling system is 26 miles of conveyors; 300 computers. Fixing the incredibly buggy system requires additional 50 percent of the original budget - nearly $200m.

2005. System still does not work. Airport managers revert to baggage carts with human drivers.

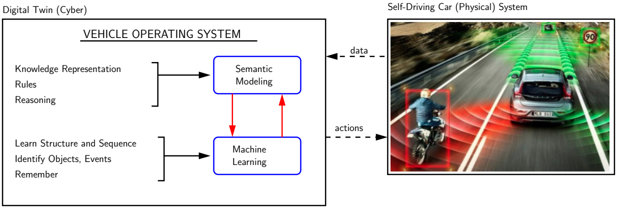
Digital Twin Systems

New Computing Infrastructure → New System Abstractions

Digital Twins (2000-today)

Definition. Virtual representation of a physical object or system that operates across the system lifecycle (not just the front end).



Digital Twin (Cyber)

VEHICLE OPERATING SYSTEM

Knowledge Representation
Rules
Reasoning

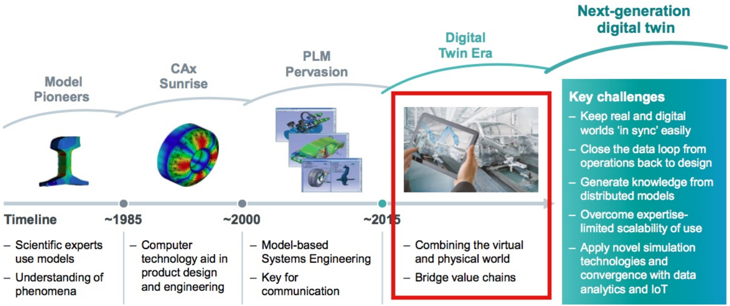
Learn Structure and Sequence
Identify Objects, Events
Remember

Self-Driving Car (Physical) System

Required Functionality

- Mirror implementation of physical world through real-time monitoring and synchronization of data with events.
- Provide algorithms and software for observation, reasoning, and physical systems control.

Digital Twins (Business Case + Applications)



- Scientific experts use models
- Understanding of phenomena

- Computer technology aid in product design and engineering

- Model-based Systems Engineering
- Key for communication

- Combining the virtual and physical world
- Bridge value chains

Key challenges

- Keep real and digital worlds 'in sync' easily
- Close the data loop from operations back to design
- Generate knowledge from distributed models
- Overcome expertise-limited scalability of use
- Apply novel simulation technologies and convergence with data analytics and IoT

Many Applications

- NASA Spacecraft
- Manufacturing processes
- Building operations
- Personalized medicine
- Smart Cities
- ... etc.

Digital Twins (Technical Implementation)

Technical Implementation (2023, Google, Siemens, IBM)

- AI and ML will be deeply embedded in new software and algorithms.

Artificial Intelligence:

- Knowledge representation and reasoning with ontologies and rules. Semantic graphs. Executable event-based processing.

Machine Learning:

- Modern neural networks. Input-to-output prediction.
- Data mining.
- Identify objects, events, and anomalies.
- Learn structure and sequence. Remember stuff.

Digital Twin: City Operating Systems

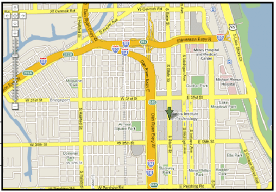
ontologies for urban structure and behavior

rules governing synthesis of urban structure / behavior

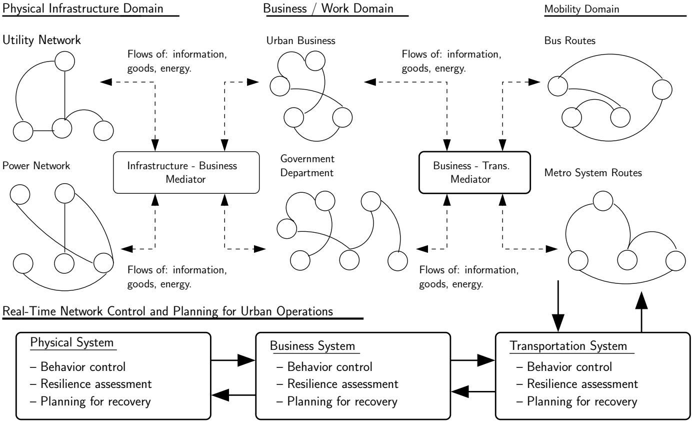
Downtown, Chicago, USA

Geo-informatics: Urban data, ontologies and rules.



Required Capability. Monitoring and control of urban processes.
Complications. Potentially, a very large number of digital twins.
Distributed decision making.

Smart City Digital Twins (2018-2019)



Physical System
- Behavior control
- Resilience assessment
- Planning for recovery

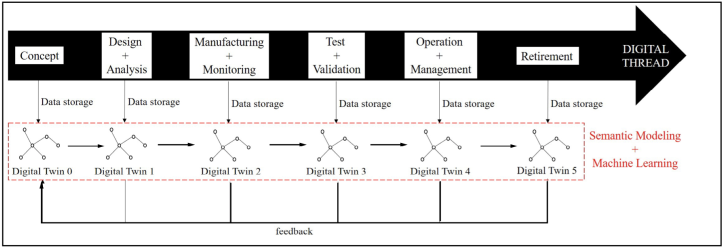
Business System
- Behavior control
- Resilience assessment
- Planning for recovery

Transportation System
- Behavior control
- Resilience assessment
- Planning for recovery

Requirements. Support for digital twin individuals and digital twin communities.

Digital Thread Systems

Digital Threads: (Cradle-to-Grave Lifecycle Support) ...



Graph-based Approach

A lot of model-centric engineering boils down to representation of systems as graphs and sequences of graph transformations punctuated by decision making and work/actions.

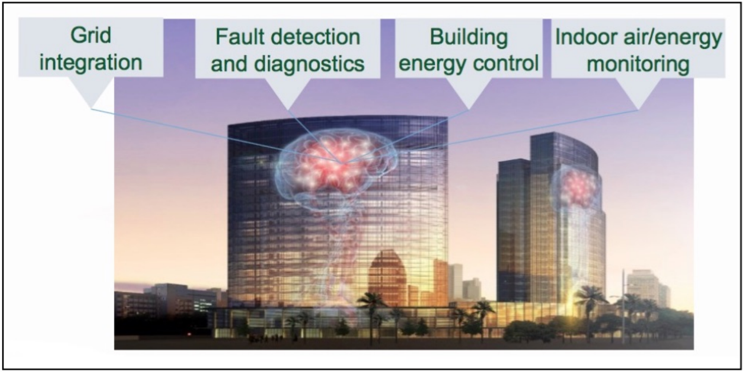
Urban Applications

How do buildings and cities work?

Modern Buildings (Vision for Future)

Example 1: Buildings that Think! (Work at NIST / UMD, 2017)



Research Question: How to use AI / Semantics to bring data, context and algorithms together for decision making?

Legend: data = building geometry; context = occupant behavior; algorithms = reasoning.

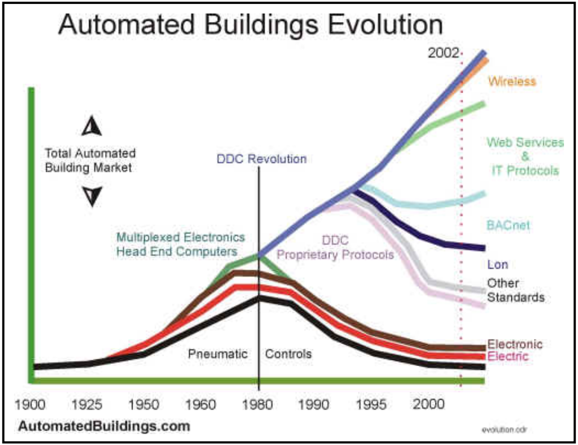
Modern Buildings (Key Features)

Modern buildings are:

- Advanced, self-contained and tightly controlled environments design to provide services (e.g., transportation, lighting, etc).
- Large size (e.g., 30,000 occupants, thousands of points of sensing and control for air quality and fire protection).
- Many stakeholders; highly multi-disciplinary.
- Building have networks for: arrangement of spaces; fixed circulatory systems (power, hvac); dynamic circulatory systems (flows of energy).
- Many sources of heterogeneous data.
- Necessity of performance-based design and real-time management.
- System functionality controlled by software!

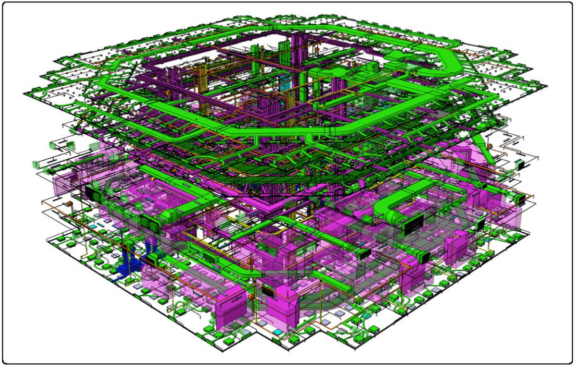
Modern Buildings (Key Features)

Large-scale building systems are packed with automation:



Modern Buildings (Key Features)

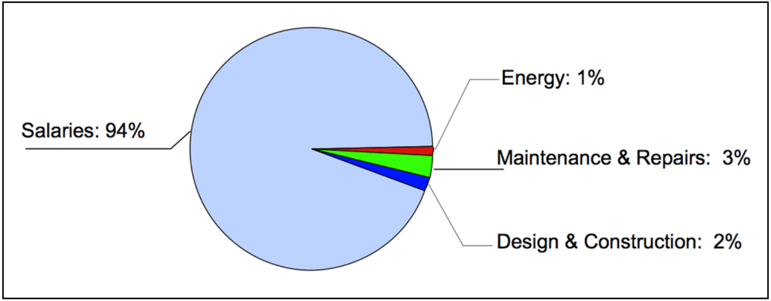
Large-scale building systems are intertwined networks of networks:



Understanding the relationships among the networks and their combined behaviors can be very challenging.

Modern Buildings (Economics)

Lifecycle costs in office buildings over a 30-Year period:



Energy systems have a huge impact on building occupant comfort and indoor air quality which, in turn, affects salary performance.

Source: United Technologies Research Center, 2009.

Modern Buildings (Integrated Energy Systems)

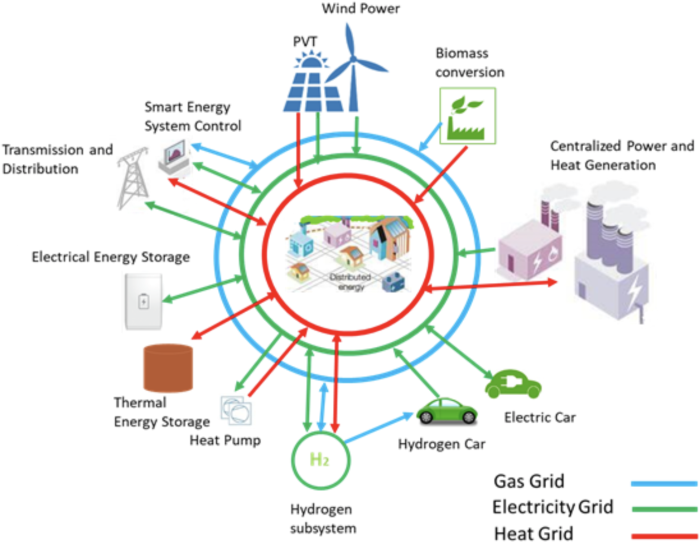
Trend toward Integrated Energy Systems:

- Commercial and residential buildings consume 1/3 of the world's energy.
- And by 2025, buildings will consume more energy than the transportation and industrial sectors combined.
- Standard models of building operation rely on centrally produced power as a source of high-grade energy.
- Advances in technology allow for consideration of alternatives, such as local production of power.

Examples:

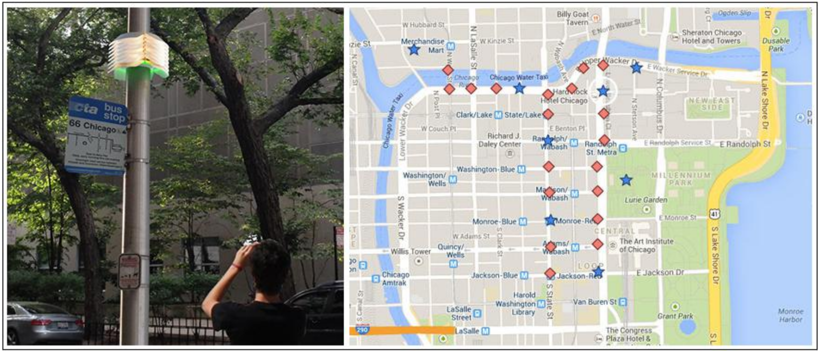
- Solar power; small-scale combined heat and power systems.
- Electricity production through use of ducted wind turbines.

Integrated Energy Systems (Proposed)



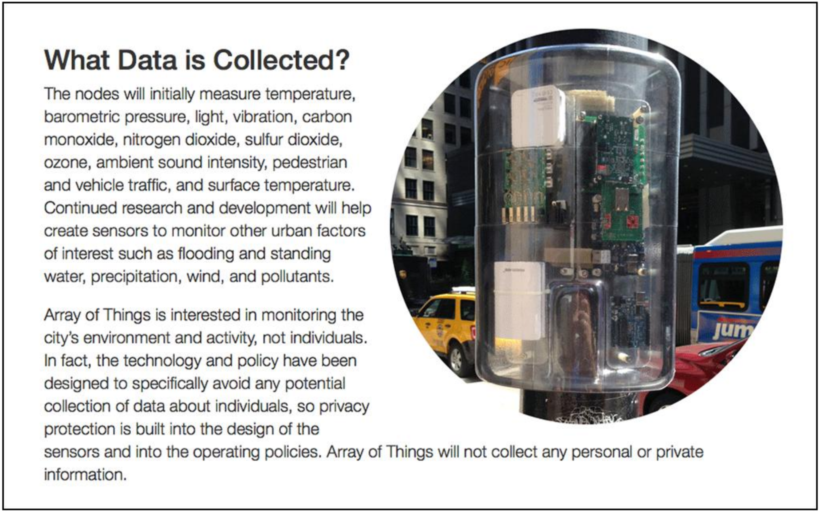
Smart Cities: Urban Sensing in Chicago

Array of Things, Chicago. Modular sensor boxes will collect real-time data on the city's environment, infrastructure and activity.



Basic Questions. How is the city used? What is going on?

Smart Cities: Urban Sensing in Chicago

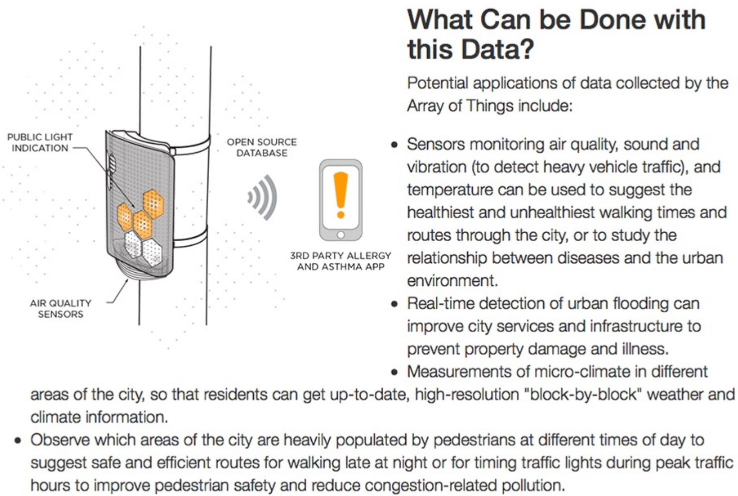


What Data is Collected?

The nodes will initially measure temperature, barometric pressure, light, vibration, carbon monoxide, nitrogen dioxide, sulfur dioxide, ozone, ambient sound intensity, pedestrian and vehicle traffic, and surface temperature. Continued research and development will help create sensors to monitor other urban factors of interest such as flooding and standing water, precipitation, wind, and pollutants.

Array of Things is interested in monitoring the city's environment and activity, not individuals. In fact, the technology and policy have been designed to specifically avoid any potential collection of data about individuals, so privacy protection is built into the design of the sensors and into the operating policies. Array of Things will not collect any personal or private information.

Smart Cities: Urban Sensing in Chicago



What Can be Done with this Data?

Potential applications of data collected by the Array of Things include:

- Sensors monitoring air quality, sound and vibration (to detect heavy vehicle traffic), and temperature can be used to suggest the healthiest and unhealthiest walking times and routes through the city, or to study the relationship between diseases and the urban environment.
- Real-time detection of urban flooding can improve city services and infrastructure to prevent property damage and illness.
- Measurements of micro-climate in different areas of the city, so that residents can get up-to-date, high-resolution "block-by-block" weather and climate information.
- Observe which areas of the city are heavily populated by pedestrians at different times of day to suggest safe and efficient routes for walking late at night or for timing traffic lights during peak traffic hours to improve pedestrian safety and reduce congestion-related pollution.

SONYC: Sounds of New York City

SONYC. A system for monitoring, analysis and mitigation of urban noise pollution.

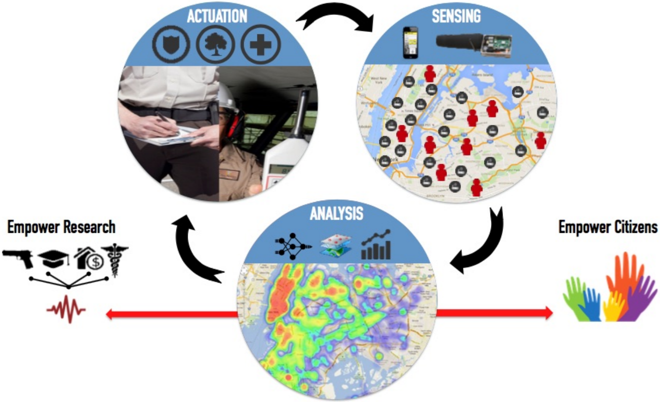
Motivation. Over 70 million people in US are exposed to noise levels beyond the limit of EPA considers to be harmful.

Short-term Problems. Sleep disruption.

Long-term Problems. Hypertension, heart disease, hearing loss.

SONYC: Sounds of New York City

Complaints. NYC authorities receive more than 800 noise-related complaints per day!



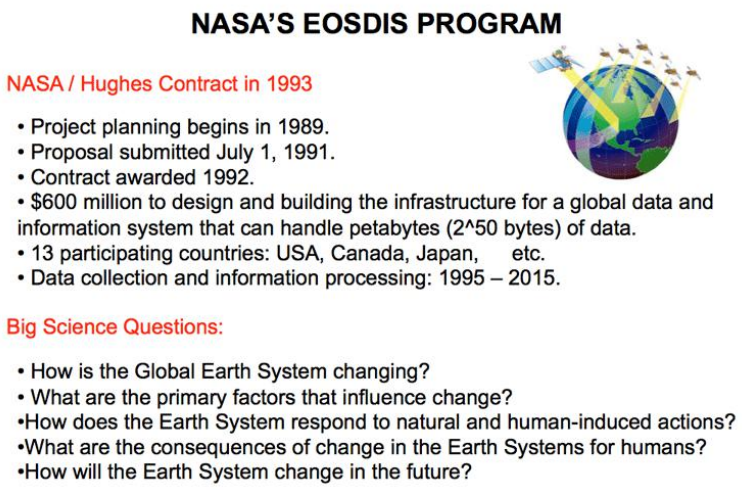
SONYC: Sounds of New York City

Noise Analytics. Analyze and understand noise pollution at a city-scale.

Global Applications

Answering Big Science Questions

NASA’s Earth Observing System



NASA’S EOSDIS PROGRAM

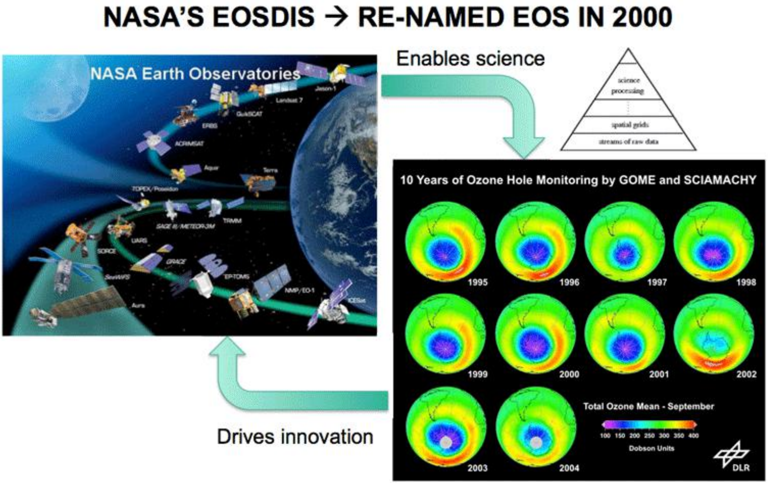
NASA / Hughes Contract in 1993

- Project planning begins in 1989.
- Proposal submitted July 1, 1991.
- Contract awarded 1992.
- $600 million to design and building the infrastructure for a global data and information system that can handle petabytes (2^50 bytes) of data.
- 13 participating countries: USA, Canada, Japan, etc.
- Data collection and information processing: 1995 – 2015.

Big Science Questions:

- How is the Global Earth System changing?
- What are the primary factors that influence change?
- How does the Earth System respond to natural and human-induced actions?
- What are the consequences of change in the Earth Systems for humans?
- How will the Earth System change in the future?

NASA's Earth Observing System



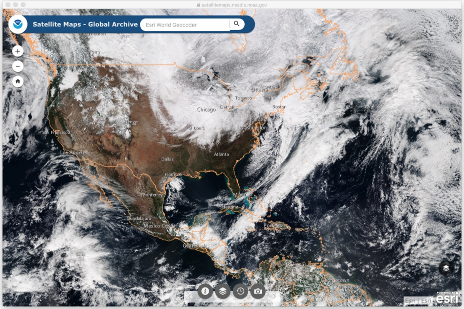
NASA'S EOSDIS → RE-NAMED EOS IN 2000

Enables science

Drives innovation

Satellite Imagery and Measurements

Understanding Climate Change

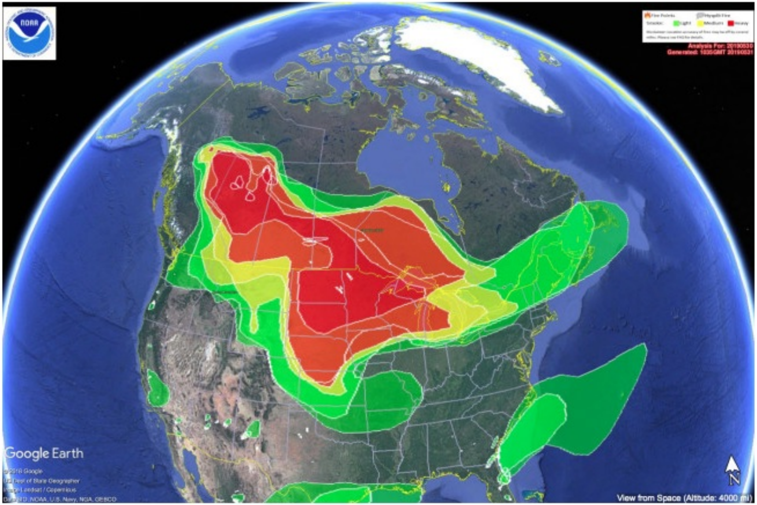


Example. Measure spatial and temporal extent of annual Snow Pack → Estimate water resources available for agriculture and urban consumption.

California Wildfires force Evacuations

Canadian Wildfires impact US

Wildfires in Alberta: Smoke covers millions of square miles:



Canadian Wildfires impact US Health/Food Chain

Poor Air Quality (Summer, 2018):

- Hundreds of wildfires in BC and WA.
- Smoke in BC drifts south to Washington State.
- Air quality in Seattle is very poor.

Wildfires impact Food Chain:

- Blankets of smoke obsure direct sunlight over orchards.
- Apples cannot grow to full size.
- Price of apples at Safeway goes up!

Canadian Wildfires impact NYC

Poor Air Quality in NYC (June, 2023):

Summary

Recurring Themes and Key Points

Recurring Themes

- Information-age systems offer enhanced functionality and better performance, but their design is more difficult than in the past.
- Physical systems and computational systems fail in completely different ways.
- Sensor networks will form the eyes and ears of complex control and information systems.
- As system complexity increases, more and more of the functionality will be managed by software!

Key Points for Building Better Systems

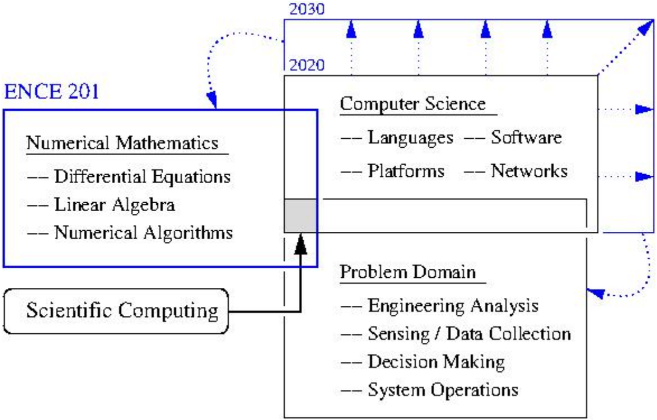
Looking Forward

Use sensing and software to build better systems:

- Improve situational awareness – to understand what is actually happending a building or city?
- Connect sensor measurements to short- and long-term urban needs (e.g., decisions on a bus stop; longer term urban planning).
- Capture the spatial, temporal, and intensity aspects of environmental phenomena (e.g., fires, flooding) and their impact on natural (e.g., air quality) and man-made systems (e.g., transportation networks, food chains).
- Look ahead and forecast future states of the system?

Central Role of Scientific Computing

Scientific computing lies at the intersection of computer science, numerical mathematics, and domain-specific problem solving.



Central Role of Scientific Computing

Computer Science and Software:

- Very fast computations.
- Mass collection of data.
- Rapidly growing importance of data sciences.
- Artificial Intelligence and Data Mining.
- Machine Learning.

Numerical and Applied Mathematics:

- Differential Equations
- Numerical Analysis and Linear Algebra.

Central Role of Scientific Computing

Large-Scale Simulation:

- Improved protection of buildings from extreme environmental loadings (e.g., earthquakes, fire, tsunamis, blast).
- To understand how consequences of global warming (e.g., sea-level rise; wild fires) will impact cities.

Improved Management of Urban Processes:

- Network systems analysis and optimization.
- New strategies for data-driven management of interdepenent urban networks.
- Prevention of cascading failures.

Computer Language for ENCE 201

Getting Started. We need learn to walk before we can run:

Capability	1970s	1980s	1990s
Languages	Fortran, C	MATLAB	Python, Java

Python

- Not too difficult – it's a reasonable place to start learning.
- Good support for data analysis and data analytics.
- Good support for numerical calculations.
- Provides a stepping stone to other languages.
