

Python Tutorial – Part I: Introduction

Mark A. Austin

University of Maryland

austin@umd.edu

ENCE 688P, Spring Semester 2022

January 18, 2023

Overview

- 1 What is Python?
 - Origins, Features, Framework for Scientific Computing
- 2 Program Development with Python
 - Working with the Terminal
 - Integrated Development Environments
- 3 Data Types
- 4 First Program (Evaluate and Plot Sigmoid Function)
- 5 Builtin Collections (Lists, Dictionaries, and Sets)
- 6 Numerical Python (NumPy)
- 7 Data and Dataset Transformation (Pandas)

Part 2

Data Types

(Data Types in Python)

Builtin Data Types

dtype	Description
Text Type:	str
Numeric Types:	int, float, complex
Sequence Types:	list, tuple, range
Mapping Type:	dict
Set Types:	set, frozenset
Boolean Type:	bool
Binary Types:	bytes, bytearray, memoryview
None Type:	NoneType

Example 1: Getting an int data type ...

```
a = 1
print ( type(a) )
```

Output:

```
< class 'int' >
```

Builtin Data Types

Example 2: Float, complex, boolean, string and list types ...

```
b = 1.5 # <-- define float ...
print ( type(b) )
c = 1.0 + 1.5j # <-- define complex ...
print ( type(c) )
d = True # <-- define boolean ...
print ( type(d) )
e = "this is a string" # <-- define string ...
print ( type(e) )
f = ["A", "B", "C", "D"] # <-- define list ...
print ( type(f) )
```

Output:

```
< class 'float' >
< class 'complex' >
< class 'bool' >
< class 'str' >
< class 'list' >
```

Builtin Data Types

Example 3: Formatting data type output ...

```

print("--- a = {:2d} ... ".format(a) );      # <-- Format integer output.
print("--- b = {:.2f} ... ".format(b) );      # <-- two-decimal places
print('--- c = {:.2f}'.format(c))            # of accuracy.
print("--- d = {:.5s} ... ".format( str(d) ))
print("--- e = {:15s} ... ".format(e) )
output = ["%.5s" % elem for elem in f ]      # <-- convert list to string ...
print("--- f = ", output )

```

Output:

```

--- a =  1 ...
--- b = 1.50 ...
--- c = 1.00+1.50j
--- d = True ...
--- e = this is a string ...
--- f =  ['A', 'B', 'C', 'D']

```

Floating-Point Numbers

Definition. Floating point variables and constants are used represent values outside of the integer range (e.g., 3.4, -45.33 and 2.714) and are either very large or small in magnitude, (e.g., 3.0e-25, 4.5e+05, and 2.34567890098e+19).

IEEE 754 Floating-Point Standard. Specifies that a floating point number take the form:

$$X = \sigma \cdot m \cdot 2^E. \quad (1)$$

Here:

- σ represents the sign of the number.
- m is the mantissa (interpreted as a fraction $0 < m < 1$).
- E is the exponent.

IEEE 754 Floating-Point Standard

Ensures floating point implementations and arithmetic are consistent across various types of computers (e.g., PC and Mac).

IEEE FLOATING POINT ARITHMETIC STANDARD FOR 32 BIT WORDS.

IEEE FLOATING POINT ARITHMETIC STANDARD FOR DOUBLE PRECISION FLOATS.

Largest and Smallest Floating-Point Numbers

```
=====
```

Type	Contains	Default Value	Size	Range and Precision
------	----------	---------------	------	---------------------

```
=====
```

```
float IEEE 754 floating point 0.0 32 bits +- 13.40282347E+38 / +- 11.40239846E-45
```

Floating point numbers are represented to approximately 6 to 7 decimal places of accuracy.

```
double IEEE 754 floating point 0.0 64 bits +- 11.79769313486231570E+308 / +- 14.94065645841246544E-324
```

Double precision numbers are represented to approximately 15 to 16 decimal places of accuracy.

```
=====
```

Working with Double Precision Numbers

Simple Example. Here is the floating point representation for 0.15625

Note. Keep in mind that floating-point numbers are stored in a binary format – this can lead to surprises.

For example, when the decimal fraction $1/10$ (0.10 in base 10) is converted to binary, the result is an expansion of infinite length.

Bottom line: You **cannot store 0.10 precisely** in a computer.

Working with Double Precision Numbers

Accessing the Math Library Module

```
import math; # <-- import the math library ...
```

Math Constants

Method	Description
math.e	Returns Euler's number (2.7182 ...).
math.inf	Returns floating-point positive infinity.
math.pi	Returns PI (3.1415926 ...).

Math Methods

Method	Description
math.acos()	Returns the arc cosine of a number.
math.acosh()	Returns the inverse hyperbolic cosine of a number.
math.asin()	Returns the arc sine of a number.
math.asinh()	Returns the inverse hyperbolic sine of a number.

Working with Double Precision Numbers

Math Methods (continued) ...

Method	Description
<code>math.atan()</code>	Returns the arc tangent of a number in radians
<code>math.atan2()</code>	Returns the arc tangent of y/x in radians
<code>math.ceil()</code>	Rounds a number up to the nearest integer
<code>math.cos()</code>	Returns the cosine of a number
<code>math.cosh()</code>	Returns the hyperbolic cosine of a number
<code>math.exp()</code>	Returns E raised to the power of x
<code>math.fabs()</code>	Returns the absolute value of a number
<code>math.floor()</code>	Rounds a number down to the nearest integer
<code>math.gcd()</code>	Returns the greatest common divisor of two integers
<code>math.isfinite()</code>	Checks whether a number is finite or not
<code>math.isinf()</code>	Checks whether a number is infinite or not
<code>math.isnan()</code>	Checks whether a value is NaN (not a number) or not
<code>math.isqrt()</code>	Rounds a square root number down to the nearest integer
<code>math.ldexp()</code>	Returns the inverse of <code>math.frexp()</code> which is $x * (2^{**i})$ of the given numbers x and i
<code>math.lgamma()</code>	Returns the log gamma value of x

Working with Double Precision Numbers

Math Methods (continued) ...

Method	Description
<code>math.log()</code>	Returns the natural logarithm of a number, or the logarithm of number to base.
<code>math.log10()</code>	Returns the base-10 logarithm of x
<code>math.log1p()</code>	Returns the natural logarithm of 1+x
<code>math.log2()</code>	Returns the base-2 logarithm of x
<code>math.perm()</code>	Returns the number of ways to choose k items from n items with order and without repetition
<code>math.pow()</code>	Returns the value of x to the power of y
<code>math.prod()</code>	Returns the product of all the elements in an iterable
<code>math.radians()</code>	Converts a degree value into radians
<code>math.remainder()</code>	Returns the closest value that can make numerator completely divisible by the denominator
<code>math.sin()</code>	Returns the sine of a number
<code>math.sinh()</code>	Returns the hyperbolic sine of a number
<code>math.sqrt()</code>	Returns the square root of a number
<code>math.tan()</code>	Returns the tangent of a number
<code>math.tanh()</code>	Returns the hyperbolic tangent of a number
<code>math.trunc()</code>	Returns the truncated integer parts of a number

Working with Double Precision Numbers

Example 4: Formatting PI ...

```
import math;          # <-- import math library.
PI = math.pi;        # <-- create user-defined constant.

print("--- PI = {:.2f} ...".format(PI) ); # <-- 2 decimal places.
print("--- PI = {:.15f} ...".format(PI) ); # <-- 15 decimal places.
print("--- PI = {:8.2f} ...".format(PI) ); # <-- 8 characters wide,
                                           #      2 decimal places.
print("--- PI = {:16.12f} ...".format(PI) );# <-- 16 characters wide,
                                           #      12 decimal places.
print("--- PI = {:16.6e} ...".format(PI) ); # <-- exponential format.
```

Output:

```
--- PI = 3.14 ...
--- PI = 3.141592653589793 ...
--- PI =      3.14 ...
--- PI = 3.141592653590 ...
--- PI =      3.141593e+00 ...
```

First Program

(Evaluate and Plot Sigmoid Function)

Problem Description

Problem Description

In neural network models, the sigmoid function:

$$\sigma(x) = \left[\frac{1}{1 + e^{-x}} \right]. \quad (2)$$

serves as an activation. Our first program evaluates and plots $\sigma(x)$ over the range $x \in [-10, 10]$.

Running the Program

From the terminal window, simply type:

```
prompt >> python3 TestSigmoidFunction.py
```

Evaluate and Plot Sigmoid Function

The Python interpreter/compiler will complain if one or more of the required packages (e.g., matplotlib) are missing.

Use pip to install missing Python Packages

The standard [package-management system](#) used to install and manage software packages is called [pip](#) (or pip3).

Example: And installation is easy!

```
prompt >> pip3 install numpy
prompt >> pip3 install matplotlib
```

To get a list of installed packages:

```
prompt >> pip3 list
```

Evaluate and Plot Sigmoid Function

Abbreviated Output:

Package	Version
.....	
jupyter	1.0.0
Keras	2.4.3
.....	
matplotlib	3.4.1
.....	
numpy	1.19.5
.....	
pandas	1.1.5
.....	
scikit-learn	0.24.2
scipy	1.6.2
.....	
sklearn	0.0

Program Source Code in Visual Studio Code

Program Source Code + Output in Visual Studio Code

The image shows a Visual Studio Code window with two panes. The left pane displays the source code for a Python script named `TestSigmoidFunction.py`. The code defines a sigmoid function and plots it. The right pane shows a plot titled "Figure 1" with the caption "Plot sigmoid(x) vs x". The plot shows a smooth S-shaped curve (sigmoid function) ranging from x = -10.0 to 10.0 on the x-axis and sigmoid(x) = 0.0 to 1.0 on the y-axis.

```

1 # -----
2 # TestSigmoidFunction.py: Evaluate and plot sigmoid function.
3 #
4 # Written by: Mark Austin           September, 2020
5 # -----
6
7 import math
8 import matplotlib
9 import matplotlib.pyplot as plt
10 import numpy as np
11
12 # define sigmoid function ...
13
14 def sigmoid (x):
15     return 1/(1 + math.exp(-x))
16
17 # main method ...
18
19 def main():
20     print("---- Enter TestSigmoidFunction.main() ... ");
21     print("---- ----- ");
22
23     # Part 1: evaluate and print values of sigmoid function ...
24
25     xvalues = list( np.arange( -10.0, 10.0, 0.5 ) );
26     for x in xvalues:
27         print ("---- sigmoid({:6.2f}) --> ({:14.10f}).format(x, sigmoid(x));
28
29     # Part 2: Create list of sigmoid(x) values ...

```

The terminal output shows the following results:

```

---- sigmoid( 3.00) --> 0.9525761268
---- sigmoid( 3.50) --> 0.9766877692
---- sigmoid( 4.00) --> 0.9828137900

Program Source Code

Points to Note:

- Line comment statements begin with the # character.
- Lines 7-10 import the math, matplotlib, matplotlib.pyplot and numpy modules to the program, and make the functions therein available.
- Functions are the primary method of code organization and reuse in Python.
- User-defined functions are declared with the def keyword. A function contains a block of code with an optional return keyword.
- Lines 13-14 evaluate and return the sigmoid function.
- Use of the second function, main(), is a carry over from programming with C, where all programs begin their execution in main(). Its use in Python is optional.

Program Source Code

Points to Note (continued):

- Line 25 creates a list of x coordinates. The numpy function `np.arange()` covers $[-10, 10]$ in increments of 0.5.
- Lines 26-27 systematically traverse the elements of `xvalues`, and compute and print the corresponding values of the `sigmoid()` function.
- Line 27 formats and prints the output. The specification `{:6.2}f` means that the output should be printed as a floating point number, six characters wide, and with two decimal places of accuracy to the right of the decimal point.
- Lines 31-33 traverse the elements of `xvalues`, and systematically assemble a list of sigmoid function `yvalues`.
- Lines 37-47 format a plot of `yvalues` vs `xvalues`, and save to `sigmoid-plot.jpg`.
