

Summary

- ▶ [The JGraphT library](#)
- ▶ [Creating graphs](#)
- ▶ [Visits in JGraphT](#)

JGraphT

- ▶ <http://jgrapht.org>
 - ▶ (do not confuse with jgraph.com)
- ▶ Free Java graph library that provides graph objects and algorithms
- ▶ Easy, type-safe and extensible thanks to `<generics>`
- ▶ Just add **jgrapht-core-0.9.0.jar** to your project

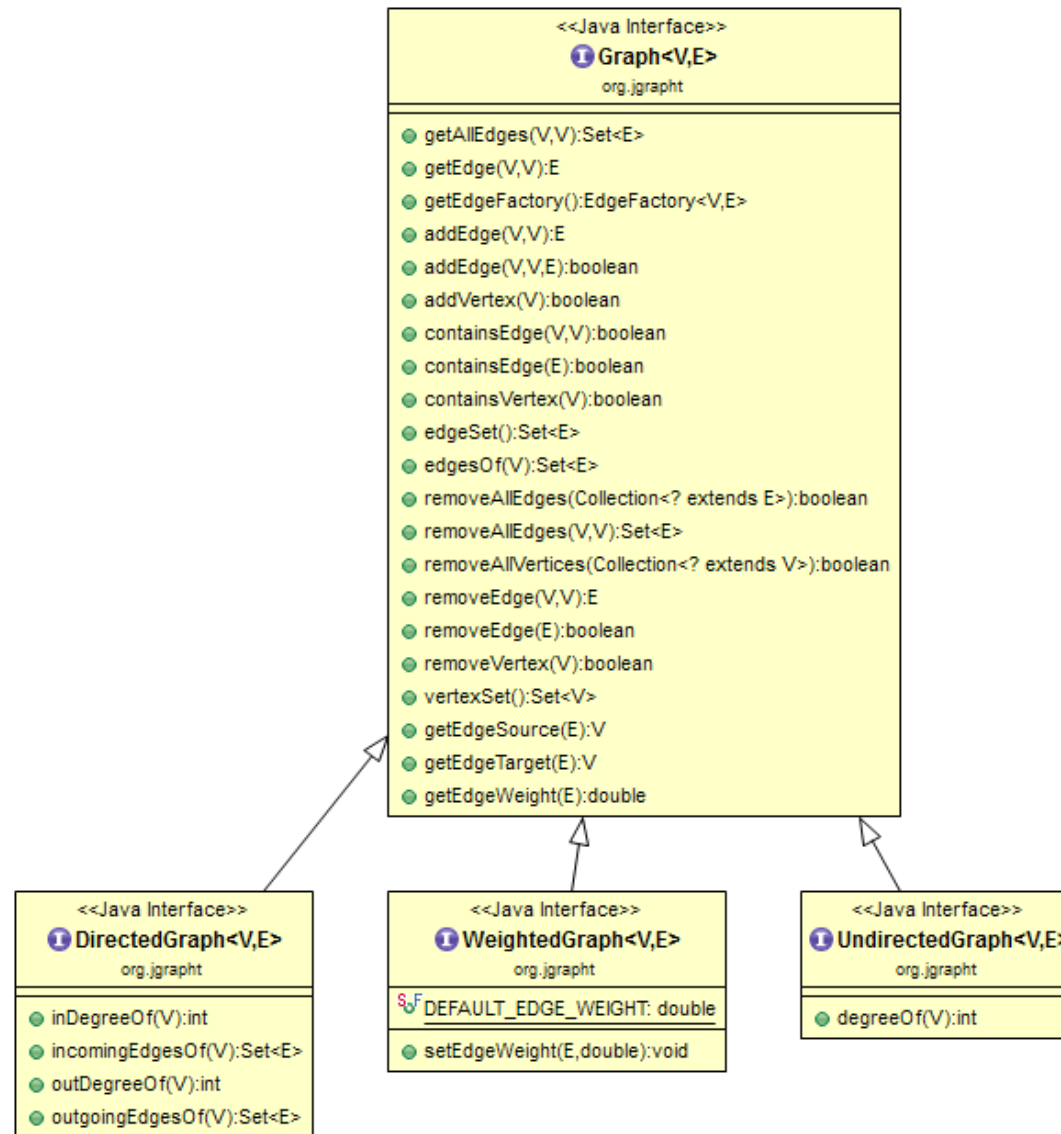

JGraphT structure

| Packages | |
|-----------------------------|--|
| org.jgrapht | The front-end API's interfaces and classes, including Graph, DirectedGraph and UndirectedGraph. |
| org.jgrapht.alg | Algorithms provided with JGraphT. |
| org.jgrapht.alg.util | Utilities used by JGraphT algorithms. |
| org.jgrapht.demo | Demo programs that help to get started with JGraphT. |
| org.jgrapht.event | Event classes and listener interfaces, used to provide a change notification mechanism on graph modification events. |
| org.jgrapht.ext | Extensions and integration means to other products. |
| org.jgrapht.generate | Generators for graphs of various topologies. |
| org.jgrapht.graph | Implementations of various graphs. |
| org.jgrapht.traverse | Graph traversal means. |
| org.jgrapht.util | Non-graph-specific data structures, algorithms, and utilities used by JGraphT. |

Graph objects

- ▶ **All graphs derive from**
 - ▶ Interface `Graph<V, E>`
 - ▶ `V` = type of vertices
 - ▶ `E` = type of edges
 - ▶ usually `DefaultEdge` or `DefaultWeightedEdge`
- ▶ **Main interfaces**
 - ▶ `DirectedGraph<V, E>`
 - ▶ `UndirectedGraph<V, E>`
 - ▶ `WeightedGraph<V, E>`

JGraphT main interfaces

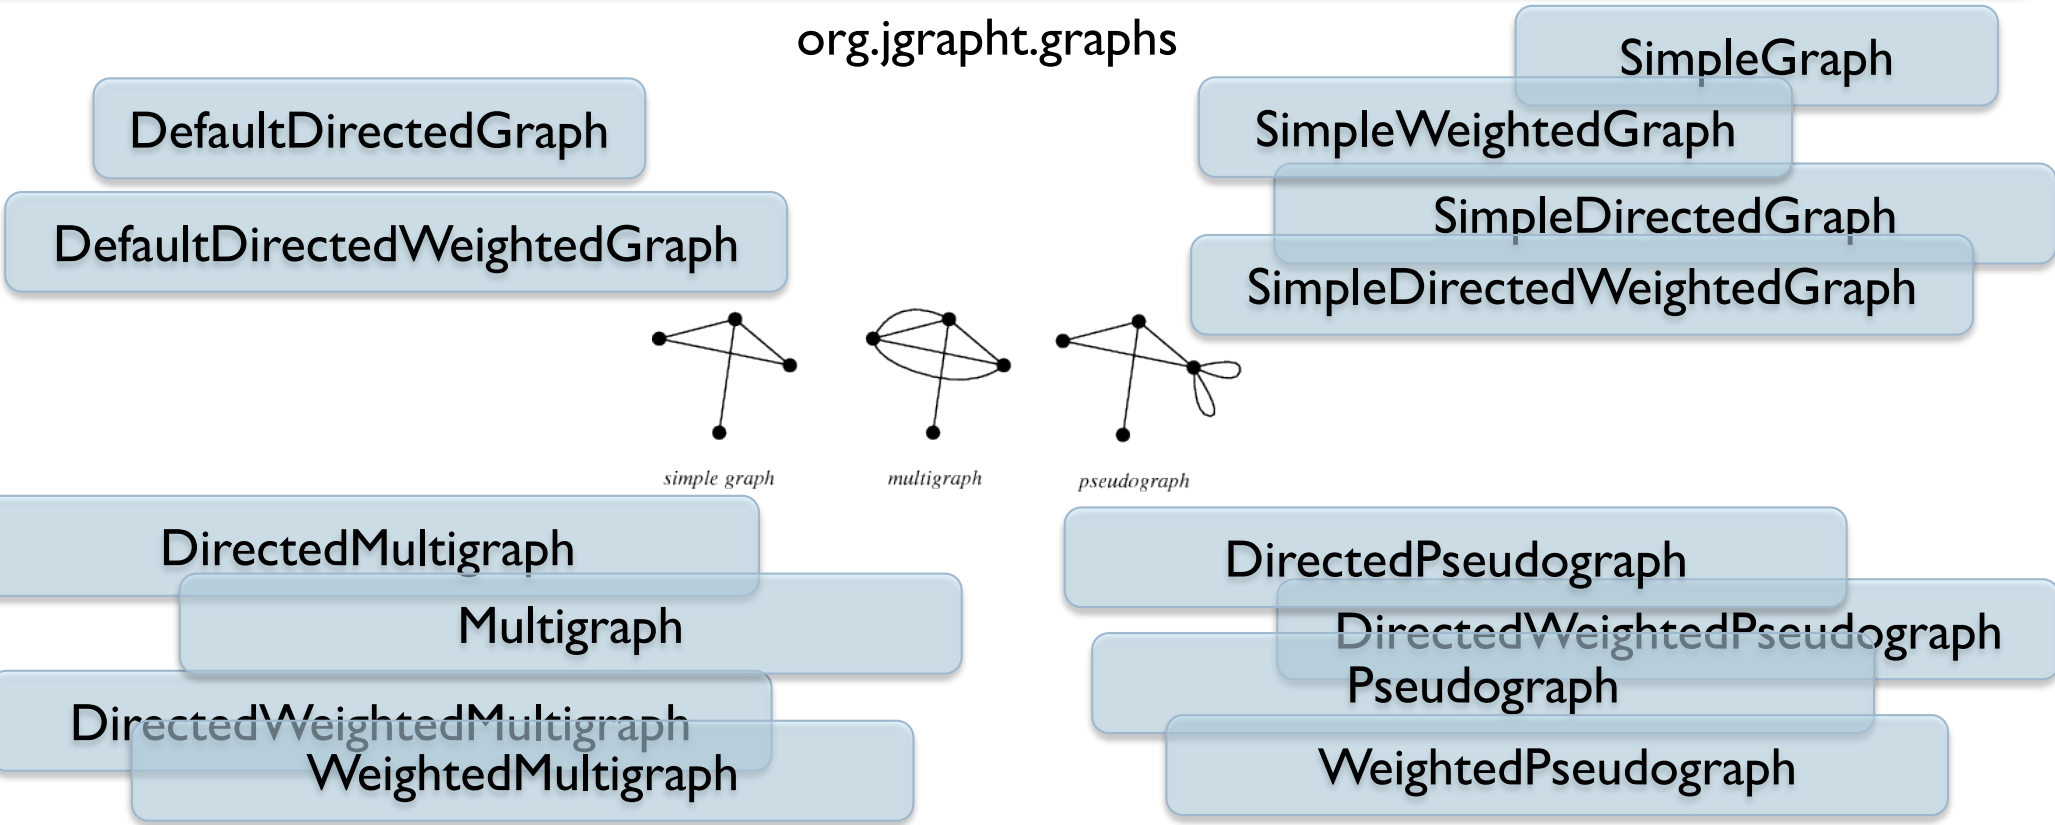

Graph classes

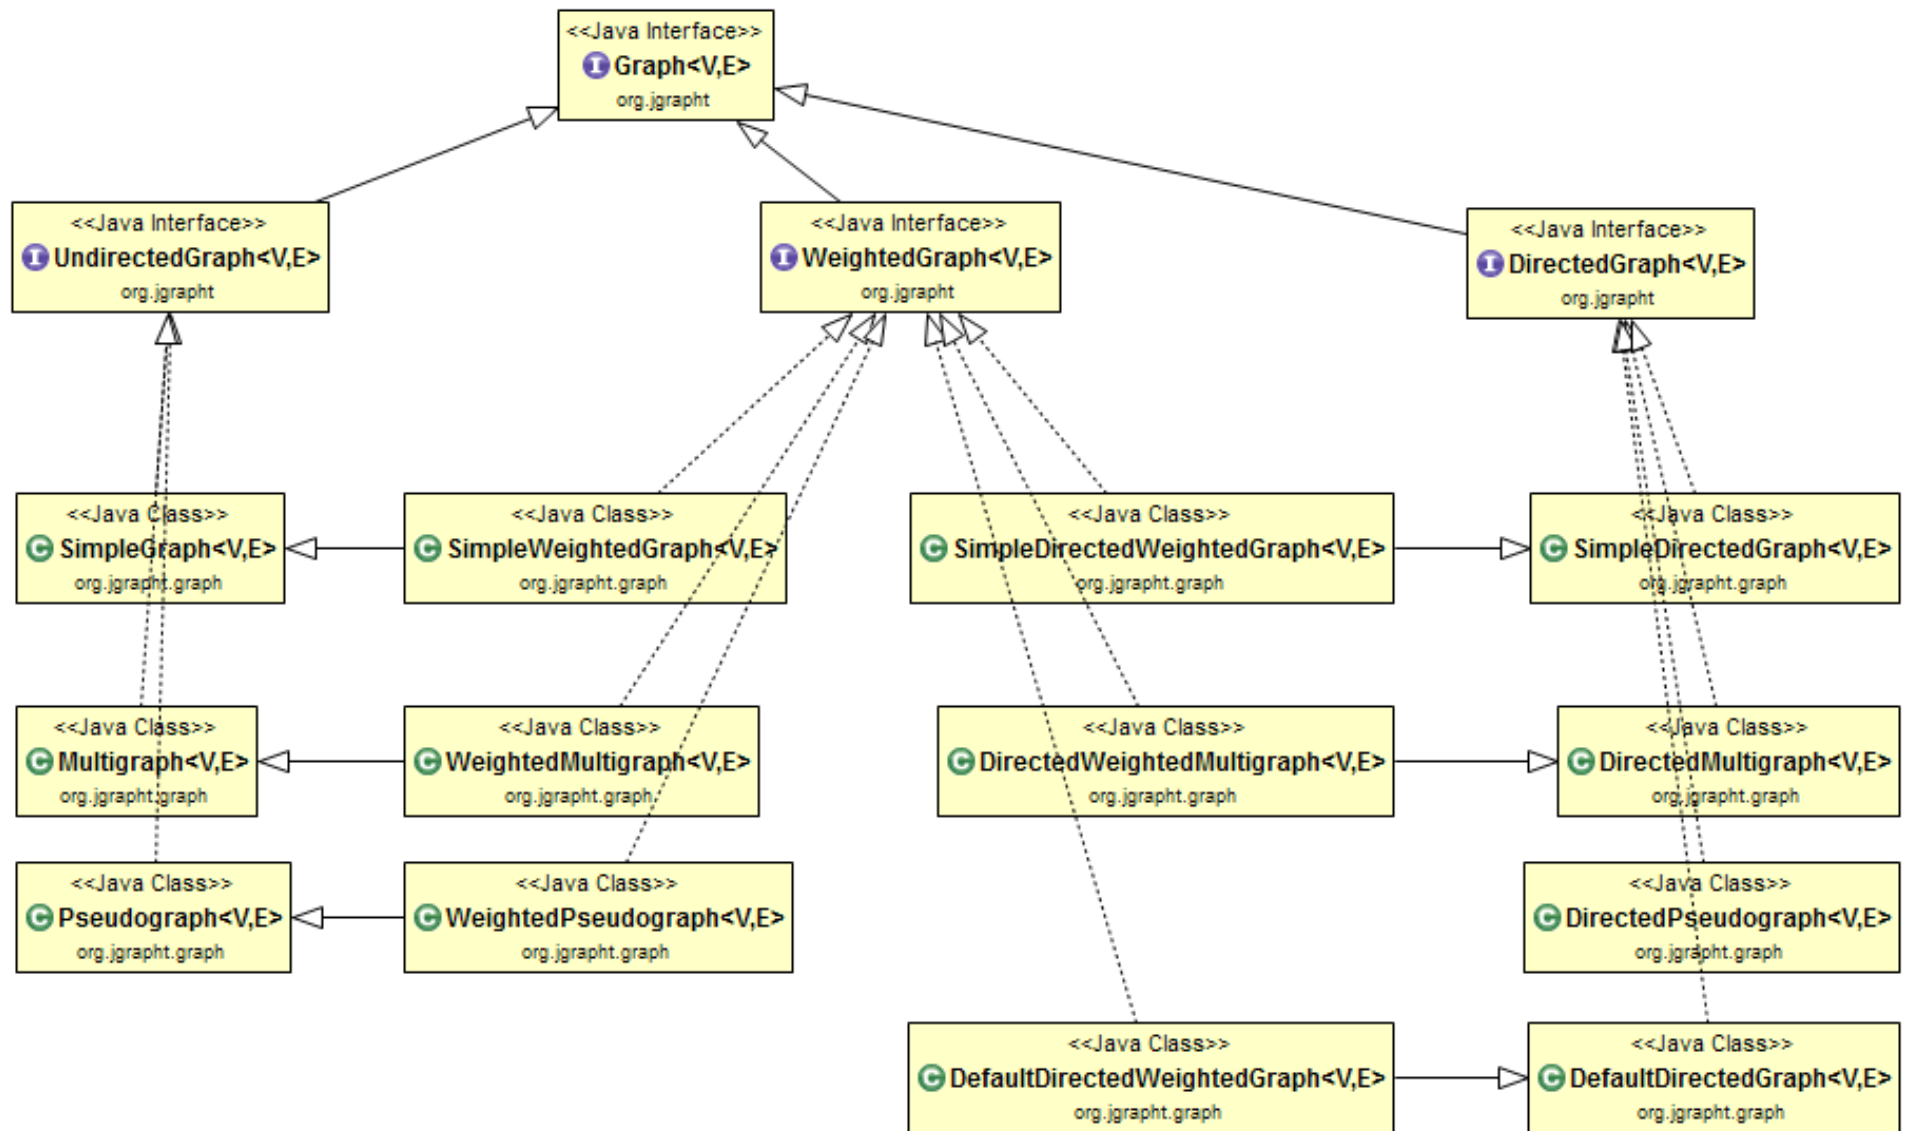

org.jgrapht

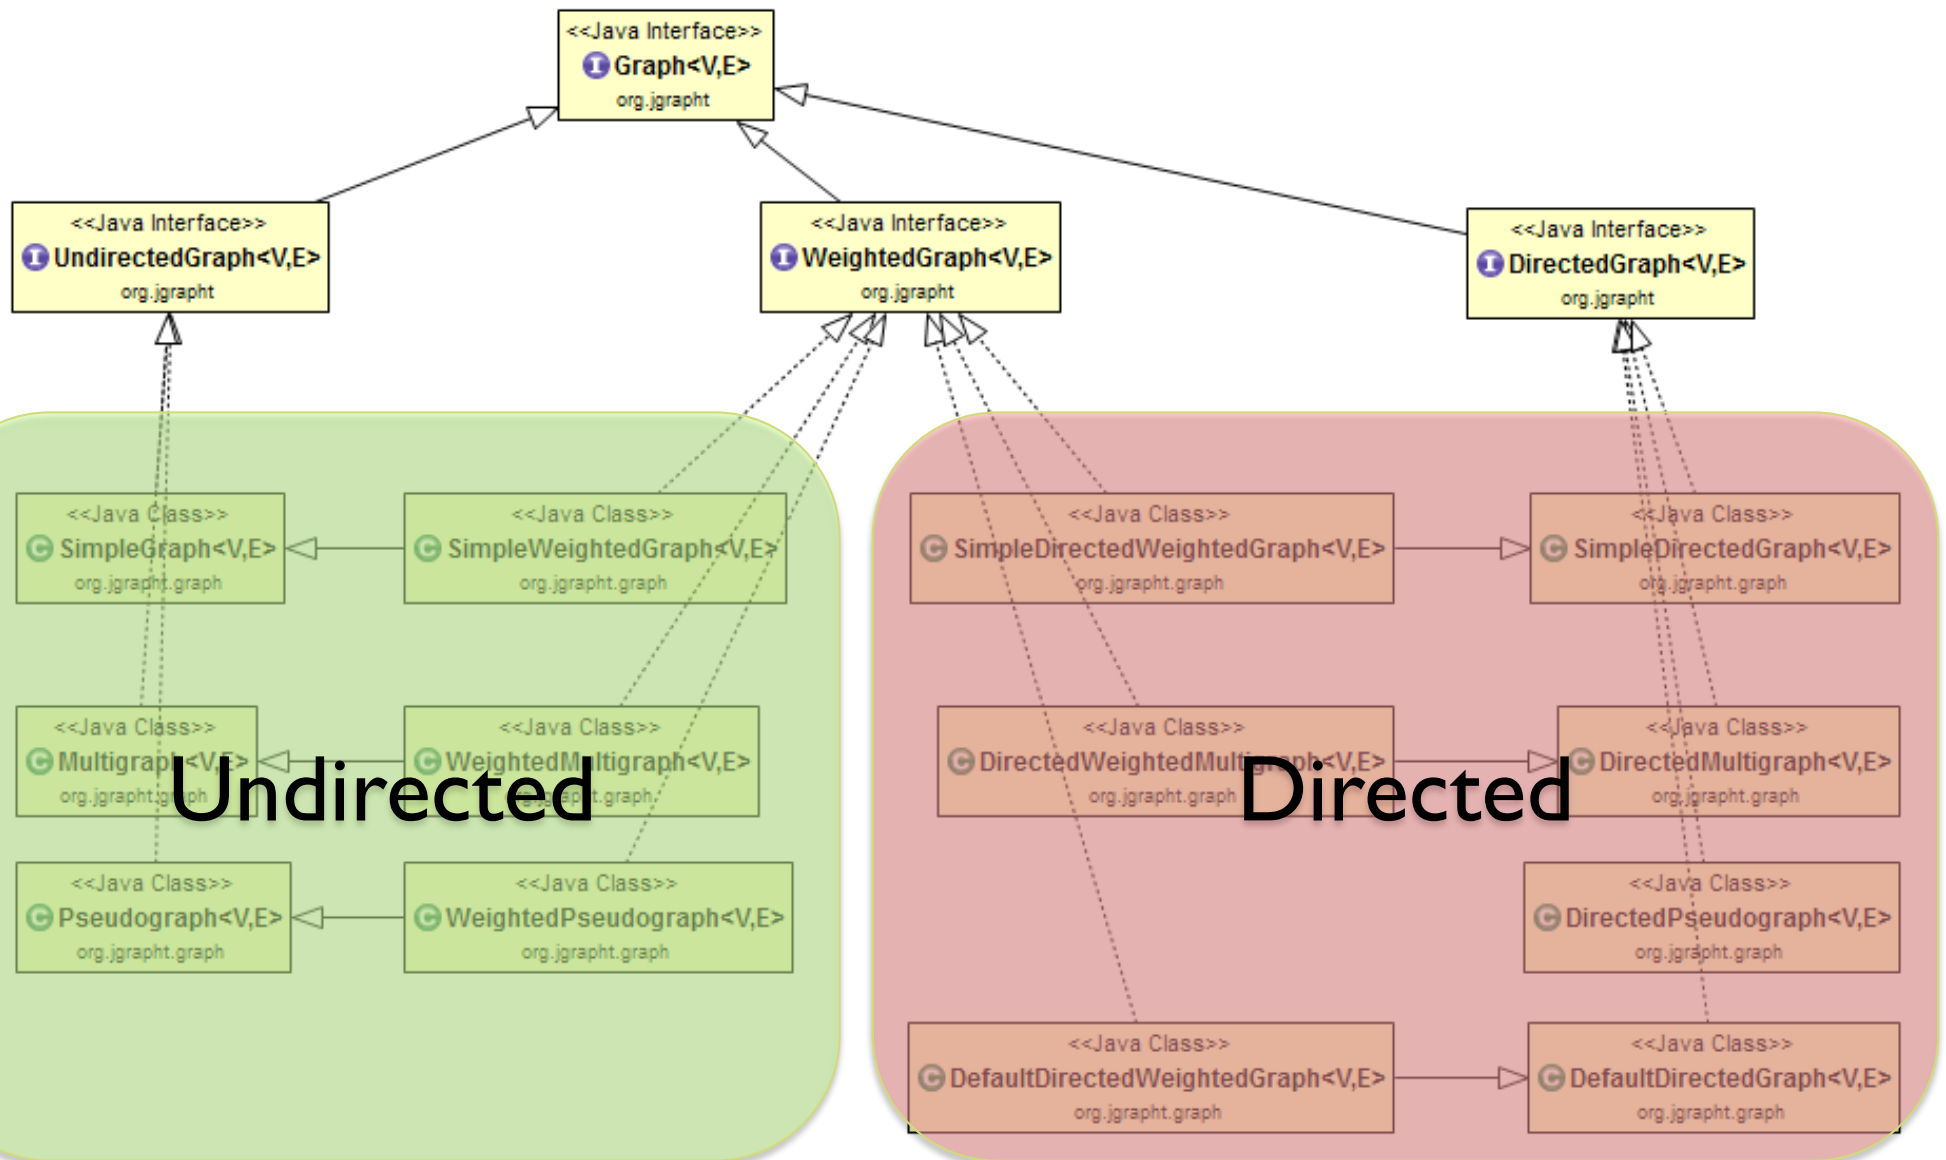

org.jgrapht.graphs

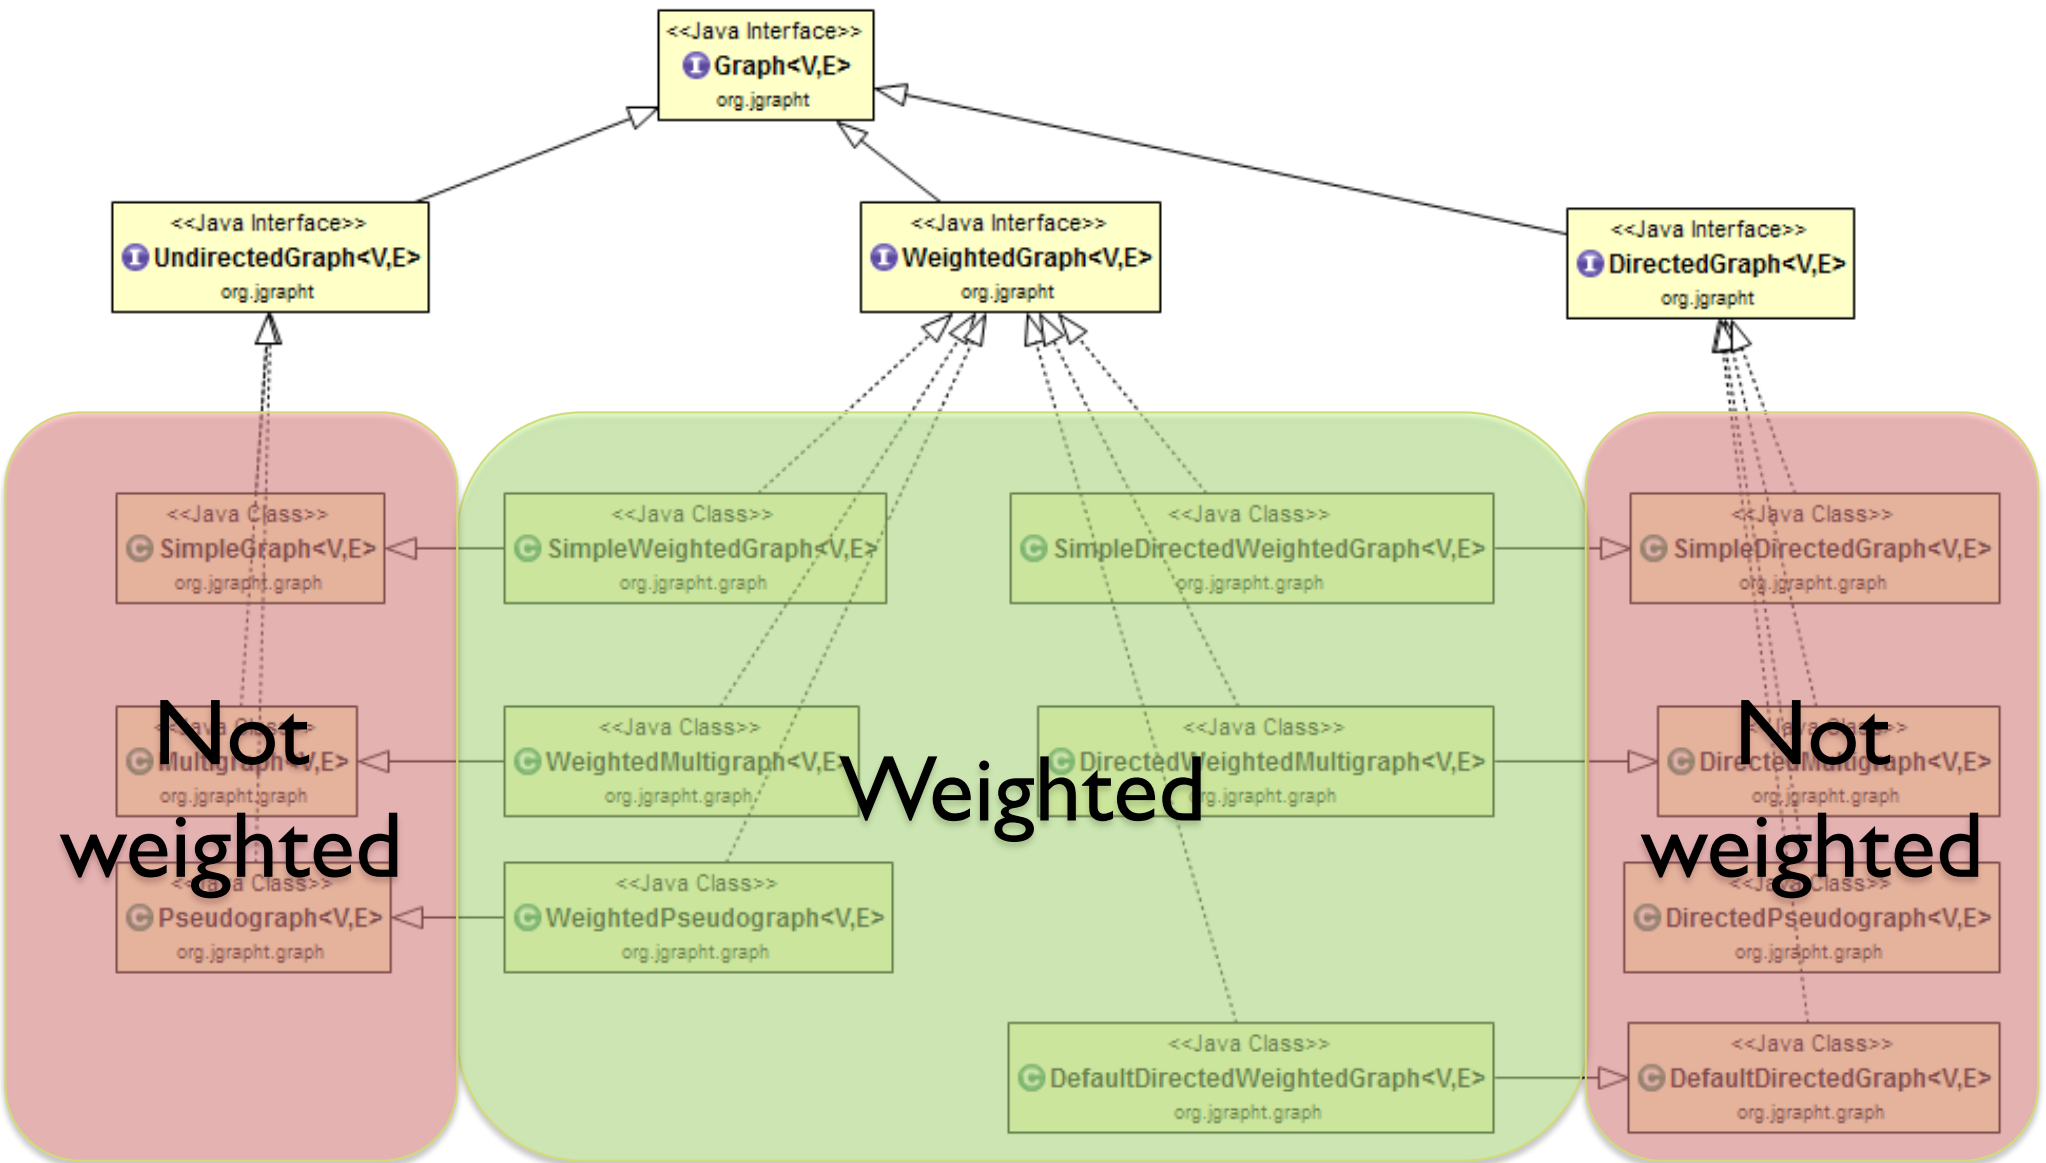

Graph classes

Graph classes

Graph classes

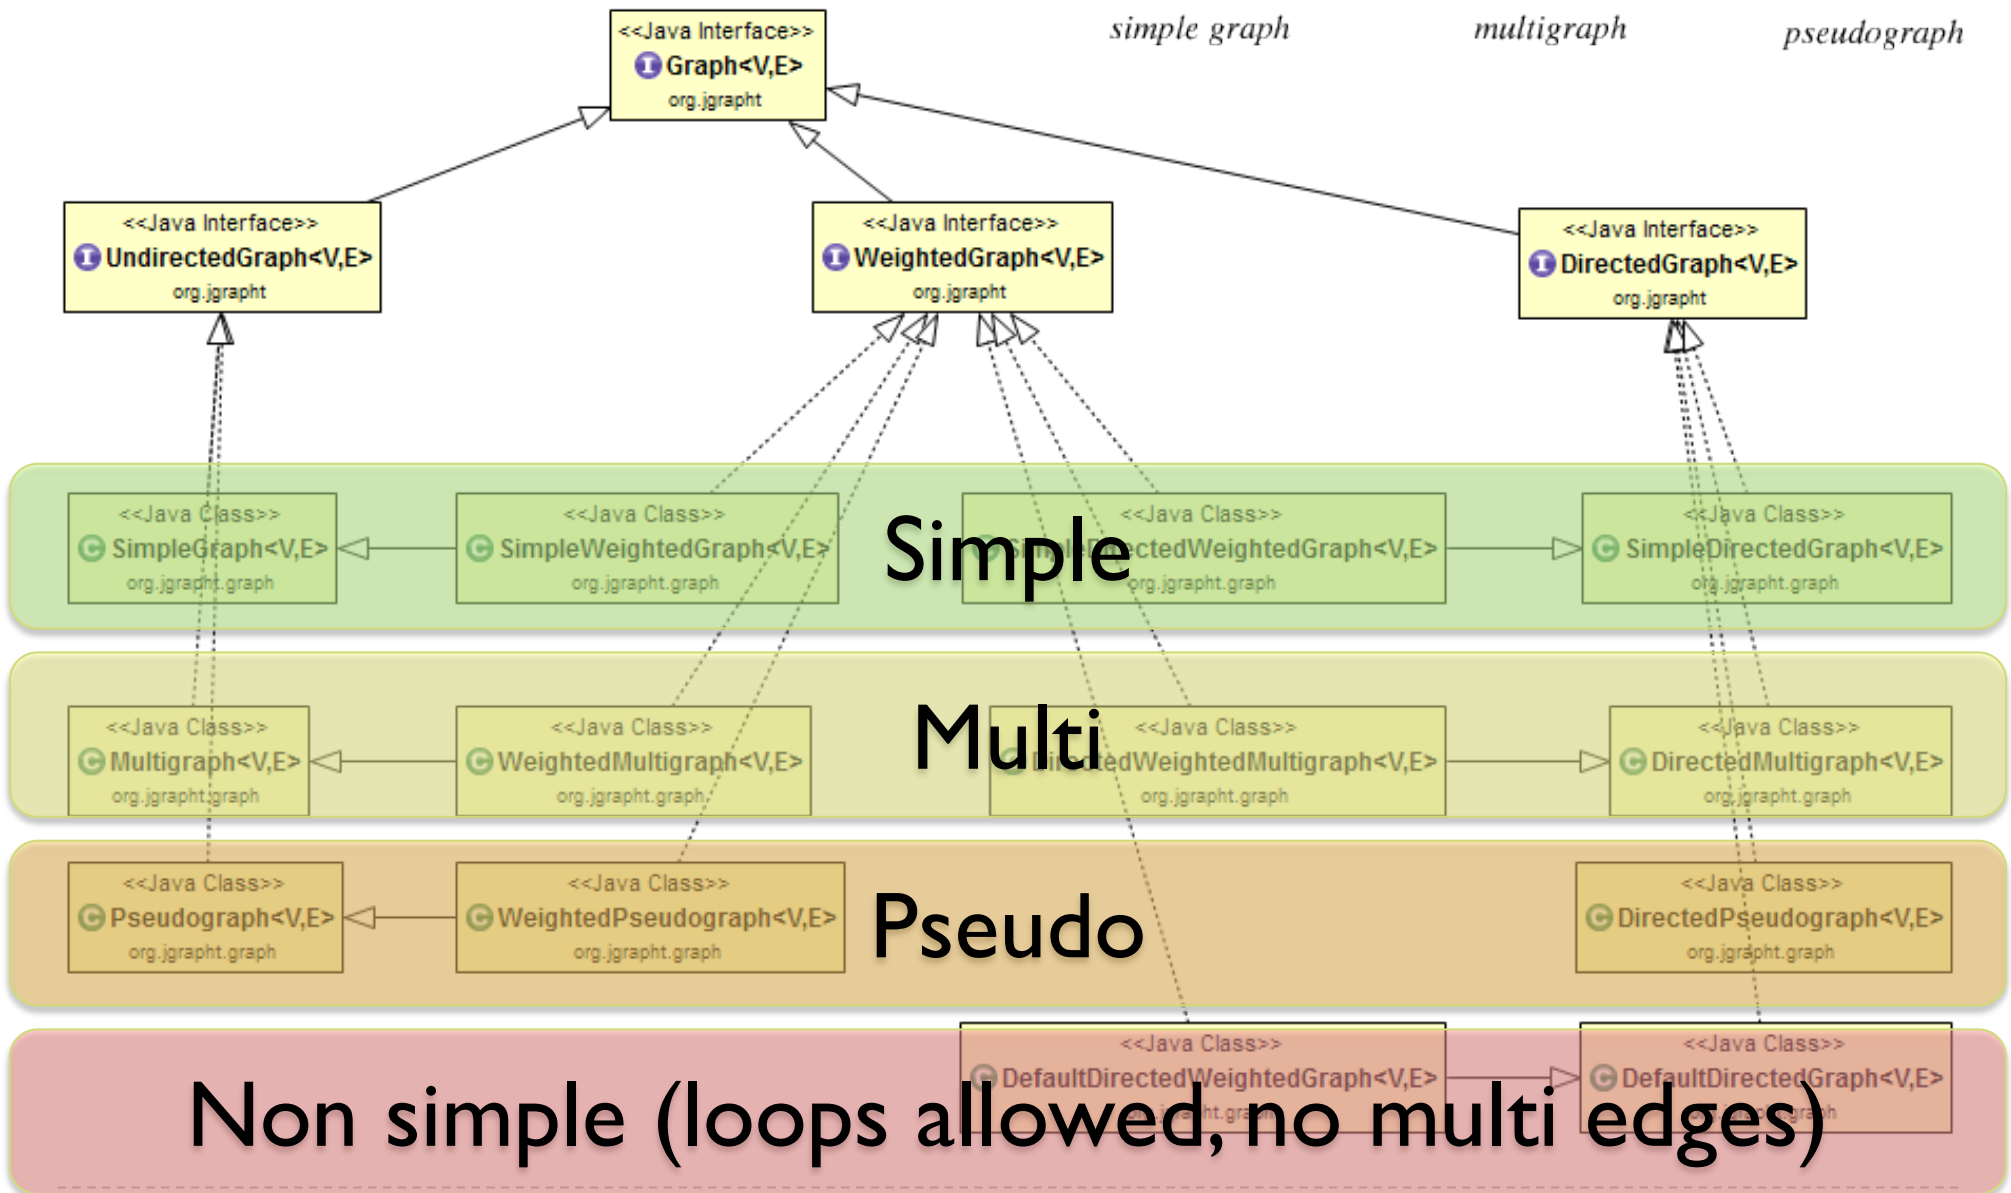

Graph classes

simple graph

multigraph

pseudograph

Creating graphs

- ▶ Construct your desired type of graph
- ▶ Add vertices
 - ▶ boolean **addVertex**(V v)
- ▶ Add edges
 - ▶ E **addEdge**(V sourceVertex, V targetVertex)
 - ▶ boolean **addEdge**(V sourceVertex, V targetVertex, E e)
 - ▶ void **setEdgeWeight**(E e, double weight)
- ▶ Print graph (for debugging)
 - ▶ toString()
- ▶ Warning: E and V should correctly implement **.equals()** and **.hashCode()**

Example

```
UndirectedGraph<String, DefaultEdge> graph = new  
SimpleGraph<>(DefaultEdge.class) ;
```

```
graph.addVertex("A") ;  
graph.addVertex("B") ;  
graph.addVertex("C") ;
```

```
graph.addEdge("A", "B") ;  
graph.addEdge("A", "C") ;
```

Example

```
for( String s: graph.vertexSet() ) {  
    System.out.println("Vertex "+s) ;  
    for( DefaultEdge e: graph.edgesOf(s) ) {  
        System.out.println("Degree: “  
            +graph.degreeOf(s)) ;  
        System.out.println(  
            Graphs.getOppositeVertex(  
                graph, e, s)) ;  
    }  
}
```

Example

For testing...

Package org.jgrapht.generate

Generators for graphs of various topologies.

See:

[Description](#)

Interface Summary

| | |
|---|--|
| GraphGenerator<V,E,T> | GraphGenerator defines an interface for generating new graph structures. |
| RandomGraphGenerator.EdgeTopologyFactory<VV,EE> | This class is used to generate the edge topology for a graph. |

Class Summary

| | |
|--|---|
| CompleteBipartiteGraphGenerator<V,E> | Generates a complete bipartite graph of any size. |
| CompleteGraphGenerator<V,E> | Generates a complete graph of any size. |
| EmptyGraphGenerator<V,E> | Generates an empty graph of any size. |
| GridGraphGenerator<V,E> | Generates a bidirectional grid graph of any size. |
| HyperCubeGraphGenerator<V,E> | Generates a hyper cube graph of any size. |
| LinearGraphGenerator<V,E> | Generates a linear graph of any size. |
| RandomGraphGenerator<V,E> | This Generator creates a random-topology graph of a specified number of vertexes and edges. |
| RingGraphGenerator<V,E> | Generates a ring graph of any size. |
| ScaleFreeGraphGenerator<V,E> | Generates directed or undirected scale-free network of any size. |
| StarGraphGenerator<V,E> | Generates a star graph of any size. |
| WheelGraphGenerator<V,E> | Generates a wheel graph of any size. |

- Google Transit

Learn more about GTFS

The [General Transit Feed Specification](#) (GTFS) can be used to share *static* public transit data.

Learn more about GTFS-realtime

The [GTFS-realtime specification](#) is an extension to GTFS that can be used to share *real-time* public transit data.

GTFS Specification

| Filename | Required | Defines |
|---------------------|----------|---|
| agency.txt | Required | One or more transit agencies that provide the data in this feed. |
| stops.txt | Required | Individual locations where vehicles pick up or drop off passengers. |
| routes.txt | Required | Transit routes. A route is a group of trips that are displayed to riders as a single service. |
| trips.txt | Required | Trips for each route. A trip is a sequence of two or more stops that occurs at specific time. |
| stop_times.txt | Required | Times that a vehicle arrives at and departs from individual stops for each trip. |
| calendar.txt | Required | Dates for service IDs using a weekly schedule. Specify when service starts and ends, as well as days of the week where service is available. |
| calendar_dates.txt | Optional | Exceptions for the service IDs defined in the calendar.txt file. If calendar_dates.txt includes ALL dates of service, this file may be specified instead of calendar.txt. |
| fare_attributes.txt | Optional | Fare information for a transit organization's routes. |
| fare_rules.txt | Optional | Rules for applying fare information for a transit organization's routes. |
| shapes.txt | Optional | Rules for drawing lines on a map to represent a transit organization's routes. |
| frequencies.txt | Optional | Headway (time between trips) for routes with variable frequency of service. |
| transfers.txt | Optional | Rules for making connections at transfer points between routes. |
| feed_info.txt | Optional | Additional information about the feed itself, including publisher, version, and expiration information. |

Querying graph structure

▶ Navigate structure

- ▶ `java.util.Set<V> vertexSet()`
- ▶ `boolean containsVertex(V v)`
- ▶ `boolean containsEdge(V sourceVertex, V targetVertex)`
- ▶ `java.util.Set<E> edgesOf(V vertex)`
- ▶ `java.util.Set<E> getAllEdges(V sourceVertex, V targetVertex)`

▶ Query Edges

- ▶ `V getEdgeSource(E e)`
- ▶ `V getEdgeTarget(E e)`
- ▶ `double getEdgeWeight(E e)`

Utility functions

- ▶ Static class **org.jgrapht.Graphs**

- ▶ Easier creation

- ▶ `public static <V,E> E addEdge(Graph<V,E> g, V sourceVertex, V targetVertex, double weight)`
- ▶ `public static <V,E> E addEdgeWithVertices(Graph<V,E> g, V sourceVertex, V targetVertex)`

- ▶ Easier navigation

- ▶ `public static <V,E> java.util.List<V> neighborListOf(Graph<V,E> g, V vertex)`
- ▶ `public static String getOppositeVertex(Graph<String, DefaultEdge> g, DefaultEdge e, String v)`
- ▶ `public static <V,E> java.util.List<V> predecessorListOf(DirectedGraph<V,E> g, V vertex)`
- ▶ `public static <V,E> java.util.List<V> successorListOf(DirectedGraph<V,E> g, V vertex)`

JGraphT and visits

- ▶ Visits are called “traversals”
- ▶ Implemented through **iterator** classes
- ▶ Package **org.jgrapht.traverse**

Graph traversal classes

Package org.jgrapht.traverse

Graph traversal means.

See:

[Description](#)

Interface Summary

| | |
|--|-------------------|
| GraphIterator<V,E> | A graph iterator. |
|--|-------------------|

Class Summary

| | |
|---|---|
| AbstractGraphIterator<V,E> | An empty implementation of a graph iterator to minimize the effort required to implement graph iterators. |
| BreadthFirstIterator<V,E> | A breadth-first iterator for a directed and an undirected graph. |
| ClosestFirstIterator<V,E> | A closest-first iterator for a directed or undirected graph. |
| CrossComponentIterator<V,E,D> | Provides a cross-connected-component traversal functionality for iterator subclasses. |
| DepthFirstIterator<V,E> | A depth-first iterator for a directed and an undirected graph. |
| TopologicalOrderIterator<V,E> | Implements topological order traversal for a directed acyclic graph. |

Graph iterators

- ▶ Usual hasNext() and next() methods
- ▶ May register event listeners to traversal steps
 - ▶ void **addTraverserListener**(TraverserListener<V,E> l)
- ▶ TraverserListeners may react to:
 - ▶ Edge traversed
 - ▶ Vertex traversed
 - ▶ Vertex finished
 - ▶ Connected component started
 - ▶ Connected component finished

Types of traversal iterators

- ▶ **BreadthFirstIterator**
- ▶ **DepthFirstIterator**
- ▶ **ClosestFirstIterator**
 - ▶ The metric for *closest* here is the path length from a start vertex. `Graph.getEdgeWeight(Edge)` is summed to calculate path length. Optionally, path length may be bounded by a finite radius.
- ▶ **TopologicalOrderIterator**
 - ▶ A topological sort is a permutation p of the vertices of a graph such that an edge $\{i,j\}$ implies that i appears before j in p . Only directed acyclic graphs can be topologically sorted.
